- N. Stub three 1-inch empty conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future. Stub three 1-inch empty conduits into raised floor space or below slab not on grade.
- O. Mount spare fuse cabinet in accessible location.

3.3 IDENTIFICATION

- A. Identify field-installed conductors, interconnecting wiring, and components; install warning signs complying with requirements in Section 260553 "Identification for Electrical Systems."

- B. Create a directory to indicate installed circuit loads; incorporate Owner's final room designations. Obtain approval before installing. Handwritten directories are not acceptable. Install directory inside panelboard door.
- C. Panelboard Nameplates: Label each panelboard with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- D. Device Nameplates: Label each branch circuit device in power panelboards with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- E. Install warning signs complying with requirements in Section 260553 "Identification for Electrical Systems" identifying source of remote circuit.

3.4 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- C. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.
- D. Tests and Inspections:
 - 1. Perform each visual and mechanical inspection and electrical test for low-voltage air circuit breakers and low-voltage surge arrestors stated in NETA ATS, Paragraph 7.6 Circuit Breakers and Paragraph 7.19.1 Surge Arrestors, Low-Voltage. Do not perform optional tests. Certify compliance with test parameters.
 - 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
- E. Panelboards will be considered defective if they do not pass tests and inspections.
- F. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes scanning results, with comparisons of the two scans. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 ADJUSTING

- A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges per Coordination Study.

3.6 PROTECTION

- A. Temporary Heating: Prior to energizing panelboards, apply temporary heat to maintain temperature according to manufacturer's written instructions.

END OF SECTION 262416

SECTION 262713 - ELECTRICITY METERING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes electricity metering.

1.2 DEFINITIONS

- A. KY or KYZ Pulse: Term used by the metering industry to describe a method of measuring consumption of electricity (kWh) that is based on a relay opening and closing in response to the rotation of the disk in the meter. Electronic meters generate pulses electronically.

1.3 ACTION SUBMITTALS

- A. Product Data:
 - 1. For each type of meter.
 - 2. For metering infrastructure components.
 - 3. For metering software.
- B. Shop Drawings: For electricity-metering equipment.
 - 1. Include elevation views of front panels of control and indicating devices and control stations.
 - 2. Include diagrams for power, signal, and control wiring.
 - 3. Wire Termination Diagrams and Schedules: Include diagrams for power, signal, and control wiring. Identify terminals and wiring designations and color-codes to facilitate installation, operation, and maintenance. Indicate recommended types, wire sizes, and circuiting arrangements for field-installed wiring, and show circuit protection features. Differentiate between manufacturer-installed and field-installed wiring.
 - 4. Include series-combination rating data for modular meter centers with main disconnect device.
 - 5. Block Diagram: Show interconnections between components specified in this Section and devices furnished with power distribution system components. Indicate data communication paths and identify networks, data buses, data gateways, concentrators, and other devices used. Describe characteristics of network and other data communication lines.

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Submit evidence that meters are compatible with connected monitoring and control devices and systems specified in Section 260913 "Electrical Power Monitoring and Control."
 - 1. Show interconnecting signal and control wiring, and interface devices to show compatibility of meters.
 - 2. For reporting and billing interfaces and adapters, list network protocols and provide statements from manufacturers that input and output devices comply with interoperability requirements of the protocol.
- B. Qualification Data: For testing agency.
- C. Field quality-control reports.
- D. Sample Warranty: For special warranty.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:

1. Application and operating software documentation.
2. Software licenses.
3. Software service agreement.
4. Device address list.
5. Hard copies of manufacturer's operating specifications, user's guides for software and hardware, and PDF files on a USB storage device of hard-copy Submittal.
6. Meter data sheet for each meter, listing nameplate data and serial number, accuracy certification, and test results.
7. Meter installation and billing software startup report.

1.6 FIELD CONDITIONS

- A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service according to requirements indicated:
1. Owner shall be notified and issued written permission no fewer than two days in advance of proposed interruption of electrical service.

1.7 QUALITY ASSURANCE

- A. Testing Agency Qualifications: An NRTL.

1.8 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace components of metering equipment that fail in materials or workmanship within specified warranty period.
1. Failures include, but are not limited to, the following:
 - a. Damage from transient voltage surges.
 - b. .
 2. Warranty Period: Cost to repair or replace any parts for two years from date of Substantial Completion.
 3. Extended Warranty Period: Cost of replacement parts (materials only, f.o.b. the nearest shipping point to Project site), for eight years, that failed in service due to transient voltage surges.

1.9 COORDINATION

- A. Electrical Service Connections:
1. Coordinate with utility companies and utility-furnished components.
 - a. Comply with requirements of utility providing electrical power services.
 - b. Coordinate installation and connection of utilities and services, including provision for electricity-metering components.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with UL 916.

2.2 UTILITY METERING INFRASTRUCTURE

- A. Install metering accessories furnished by the utility company, complying with its requirements.
- B. Utility-Furnished Meters: Connect data transmission facility of metering equipment installed by the Utility.
 - 1. Data Transmission: Transmit pulse data over control-circuit conductors, classified as Class 1 per NFPA 70, Article 725. Comply with Section 260523 "Control-Voltage Electrical Power Cables."
- C. Current-Transformer Cabinets: Comply with requirements of electrical-power utility company.
- D. Meter Sockets:
 - 1. Comply with requirements of electrical-power utility company.
 - 2. Meter Sockets: Steady-state and short-circuit current ratings shall meet indicated circuit ratings.
- E. Modular Meter Center: Factory-coordinated assembly of a main service terminal box with lugs only disconnect device, wireways, meter socket modules, and feeder circuit breakers arranged in adjacent vertical sections complete with interconnecting buses.
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton.
 - b. General Electric Company.
 - c. SIEMENS Industry, Inc.; Energy Management Division.
 - d. Square D; by Schneider Electric.
 - 2. .Comply with requirements of utility company for meter center.
 - a. Comply with UL 67.
 - 3. Housing: NEMA 250, Type 1 Type 3R Type 4X enclosure.
 - 4. Meter Socket Rating: Coordinated with connected feeder circuit rating.
 - 5. Minimum Short-Circuit Rating: 22,000 42,000 65,000 100,000 Insert number A symmetrical at rated voltage.
 - 6. Steady-state and short-circuit current ratings shall have ratings that match connected circuit ratings.
 - 7. Main Disconnect Device: Circuit breaker, series-combination rated for use with downstream feeder and branch circuit breakers and having an adjustable magnetic trip setting for circuit-breaker frame sizes of 250 A and larger. Comply with requirements in Section 262816 "Enclosed Switches and Circuit Breakers." Circuit breakers shall be operable from outside the enclosure to disconnect the unit. Configure cover so it can be opened only when the disconnect switch is open.
 - 8. Main Disconnect Device: Fusible switch, UL 98 Type GD, series-combination rated by fuse manufacturer to protect downstream feeder and branch circuit breakers. Comply with requirements in Section 262816 "Enclosed Switches and Circuit Breakers." Switch shall be operable from outside the enclosure to disconnect the unit. Configure cover so that it can be opened only when the disconnect switch is open.
 - 9. Feeder Circuit Breakers: Series-combination-rated molded-case units, rated to protect downstream circuit breakers and to house load centers and panelboards that have 10,000 Insert number-A interrupting capacity.
 - a. Identification: Complying with requirements in Section 260553 "Identification for Electrical Systems."
 - b. Physical Protection: Tamper resistant, with hasp for padlock.
 - 10. Surge Protection for Main Disconnect: Factory installed, integrally mounted, UL 1449 Type 1. Comply with Section 264313 "Surge Protection for Low-Voltage Electrical Power Circuits."
 - 11. Surge Protection at Main Disconnect: Field-mounted external to the device, UL 1449 Type 2, with integral disconnect and overcurrent protective device. Comply with Section 264313 "Surge Protection for Low-Voltage Electrical Power Circuits."
 - 12. Surge Protection at Main Terminal Box: Factory installed, integrally mounted, UL 1449 Type 1. Comply with Section 264313 "Surge Protection for Low-Voltage Electrical Power Circuits."

13. Surge Protection at Main Terminal Box: Field-mounted external to the device, UL 1449 Type 2, with integral disconnect and overcurrent protective device. Comply with Section 264313 "Surge Protection for Low-Voltage Electrical Power Circuits."

F. Arc-Flash Warning Labels;

1. Labels: Comply with requirements for "Arc-Flash Warning Labels" in Section 260573.19 "Arc-Flash Studies." Apply a 3-1/2-by-5-inch thermal transfer label of high-adhesion polyester for each work location included in the analysis.
2. Labels: Comply with requirements for "Self-Adhesive Equipment Labels" and "Signs" in Section 260553 "Identification for Electrical Systems." Apply a 3-1/2-by-5-inch thermal transfer label of high-adhesion polyester for each work location included in the analysis. Labels shall be machine printed, with no field-applied markings.
 - a. The label shall have an orange header with the wording, "WARNING, ARC-FLASH HAZARD," and shall include the following information taken directly from the arc-flash hazard analysis:
 - 1) Location designation.
 - 2) Nominal voltage.
 - 3) Flash protection boundary.
 - 4) Hazard risk category.
 - 5) Incident energy.
 - 6) Working distance.
 - 7) Engineering report number, revision number, and issue date.

2.3 ELECTRICITY METERS

- A. System Description: Able to meter designated activity loads, with or without external alarm, control, and communication capabilities, or other optional features.
- B. Manufacturers: Subject to compliance with requirements, provide products by the following:
 1. Davidge Controls.
 2. Eaton.
 3. E-Mon.
 4. General Electric Company.
 5. Leviton Manufacturing Co., Inc.
 6. National Meter Industries.
 7. Sensus Metering Systems.
 8. SIEMENS Industry, Inc.; Energy Management Division.
 9. Square D; by Schneider Electric.
 10. .
 11. Comply with ANSI C12.1 and ANSI C12.20, **0.2** accuracy class.
 12. Ambient Temperature: Minus 22 deg F to plus 158 deg F.
 13. Humidity: Zero to 95 percent, noncondensing.
 14. Capacities and Characteristics:
 - a. Circuit: 120/240-V ac, 100 A.
 - b. Measure: kWh, onboard LED display.
 - c. Remote-Reading Options: None.
- C. General Requirements for Meters:
 1. Billing Meters Accuracy: 0.2 0.5 1.0 percent of reading, complying with ANSI C12.20.
 2. Meters Certification: Certified by California Type Evaluation Program Insert agency as complying with 4 CCR 4027, Article 2.2 Insert state or Federal regulatory requirement.
 3. Certify that meters comply with ANSI C12.20 requirements by a laboratory accredited by the National Voluntary Laboratory Accreditation Program (NVLAP) of the National Institute of Standards and Technology (NIST). The laboratory shall use test equipment that is certified annually and is traceable to NIST standards.

4. Enclosure: Supplied by meter manufacturer, NEMA 250, Type 1 Type 3R Type 4X minimum, with provisions for locking or sealing.
 5. Identification: Comply with requirements in Section 260553 "Identification for Electrical Systems."
 6. Onboard Nonvolatile Data Storage: kWh, until reset.
 7. Sensors: Current-sensing type, supplied by electronic meter manufacturer, with current or voltage output, selected for optimum range and accuracy for meters indicated for this application.
 - a. Type: Split and solid core, complying with recommendation of meter manufacturer.
- D. kWh Meter: Electronic single-phase and three-phase meters, measuring electricity use.
1. Voltage and Phase Configuration: Meter shall be designed for use on circuits with voltage rating and phase configuration indicated for its application.
 2. Display: LCD with characters not less than 0.25 inch high, indicating accumulative kWh and current kilowatt load. Retain accumulated kWh in a nonvolatile memory, until reset.
 3. Display: Digital electromechanical counter, indicating accumulative kWh.
- E. kWhd Meter: Electronic single-phase and three-phase meters, measuring electricity use and demand. Demand shall be integrated over a 15-minute Insert time interval.
1. Voltage and Phase Configuration: Meter shall be designed for use on circuits with voltage rating and phase configuration indicated for its application.
 2. Display: LCD with characters not less than 0.25 inch high, indicating the following:
 - a. Accumulative kWh.
 - b. Current time and date.
 - c. Current demand.
 - d. Historic peak demand.
 - e. Time and date of historic peak demand.
 3. Retain accumulated kWh and historic peak demand in a nonvolatile memory, until reset.
- F. KY and KYZ Pulse Totalizer:
1. Pulse Totalizer: An instrument for demand and billing applications where one or more utility revenue meters stream KY or KYZ energy pulses. The instrument shall totalize kWh accumulated over the user-selected period and shall log the maximum and minimum kWhd for that period. Record each period with a date/time stamp. Time period shall be user selected from one to 60 minutes.
 - a. Pulse Input: One Insert number, individually programmable, KYZ Form C (three-wire) contact pulse channels. Pulse interval, pulse rate, and minimum pulse width shall be field adjustable, set for the pulse stream provided by the utility revenue meter.
 - b. Data Totalizing Capacity of Each Channel: Not less than 149 days at 15-minute intervals.
 - c. Instrument Power: User selectable, 120-V and 277-V ac.
 - d. Clock: Line frequency.
- G. Remote Reading Options:
1. Pulse Output: KY KYZ, complete with optical sensor and interface devices.
 2. Serial Interface: RS-232.
 3. Serial Interface: RS-485, with Modbus RTU protocol Insert protocol name.
 4. USB interface.
 5. TCP/IP adapter.
- H. Current-Transformer Cabinet: Size and configuration as recommended by metering equipment manufacturer for use with indicated connected feeder and sensors.
- I. Uninterruptible Power Supply: Single phase, 120-V ac, sized and rated to provide continuous power to meter for operations of 48 Insert number hours after interruption of normal power.
1. Output: Sine wave, total harmonic distortion less than 5 percent at full load.
 2. Battery: Maintenance free, sealed, lead acid, and leakproof.

3. Control Panel: LED status display of "on-battery," "replace battery," and "overload."
- J. Data Transmission Cable: Comply with requirements in Section 260523 "Control-Voltage Electrical Power Cables."
- K. Software: PC based, a product of recommended by meter manufacturer, suitable for calculating utility cost allocation.
 1. Utility Cost Allocation: Automatically import electricity-usage records to allocate electricity costs for the following:
 - a. At least 15 departments.
 - b. At least 30 tenants or activities.
 - c. At least five processes.
 - d. At least five buildings.
 - e.
 2. Activity Billing Software: Automatically import electricity-usage records to automatically compute and prepare electricity-use statements and invoices based on electricity use and peak demand. Maintain separate directory for each allocation. Prepare summary reports in user-defined formats and time intervals.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Comply with equipment installation requirements in NECA 1.
- B. Install meters furnished by utility company. Install raceways and equipment according to utility company's written instructions. Provide empty conduits for metering leads and extend grounding connections as required by utility company.
- C. Install modular meter center according to switchboard installation requirements in NECA 400.
- D. Install arc-flash labels as required by NFPA 70.
- E. Wiring Method:
 1. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
 2. Install unshielded, twisted-pair cable for control and signal transmission conductors, complying with Section 271513 "Communications Copper Horizontal Cabling."
 3. Minimum conduit size shall be 1/2 inch.

3.2 IDENTIFICATION

- A. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
 1. Series Combination Warning Label: Self-adhesive labels, with text as required by NFPA 70.
 2. Equipment Identification Labels: Self-adhesive labels with clear protective overlay. For residential meters, provide an additional card holder suitable for typewritten card with occupant's name.

3.3 FIELD QUALITY CONTROL

- A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.
- B. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

- C. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- D. Perform tests and inspections with the assistance of a factory-authorized service representative.
- E. Tests and Inspections:
 - 1. Equipment and Software Setup:
 - a. Set meter date and time clock.
 - b. Test, calibrate, and connect pulse metering system.
 - c. Set and verify billing demand interval for demand meters.
 - d. Report settings and calibration results.
 - e. Set up reporting and billing software, insert billing location names and initial constant values and variable needed for billing computations.
 - 2. Connect a load of known kilowatt rating, **1.5 kW** minimum, to a circuit supplied by metered feeder.
 - 3. Turn off circuits supplied by metered feeder and secure them in off condition.
 - 4. Run test load continuously for eight hours minimum, or longer, to obtain a measurable meter indication. Use test-load placement and setting that ensures continuous, safe operation.
 - 5. Check and record meter reading at end of test period and compare with actual electricity used, based on test-load rating, duration of test, and sample measurements of supply voltage at test-load connection. Record test results.
 - 6. Generate test report and billing for each tenant or activity from the meter reading tests.
- F. Electricity metering will be considered defective if it does not pass tests and inspections.
- G. Prepare test and inspection reports.

3.4 SOFTWARE SERVICE AGREEMENT

- A. Technical Support: Beginning at Substantial Completion, service agreement shall include software support for two years.
- B. Upgrade Service: At Substantial Completion, update software to latest version. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system and new or revised licenses for using software.
 - 1. Upgrade Notice: At least 30 days to allow Owner to schedule and access the system and to upgrade computer equipment if necessary.

3.5 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's clerical and maintenance personnel to use, adjust, operate, and maintain the electronic metering and billing software.

END OF SECTION 262713

SECTION 262726 - WIRING DEVICES

PART 1 - GENERAL

1.1 ACTION SUBMITTALS

- A. Product Data: For each type of product.
- B. Shop Drawings: List of legends and description of materials and process used for premarking wall plates.

1.2 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

1.3 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For wiring devices to include in all manufacturers' packing-label warnings and instruction manuals that include labeling conditions.

1.4 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Floor Service-Outlet Assemblies: One for every 10, but no fewer than one.
 - 2. Poke-Through, Fire-Rated Closure Plugs: One for every five floor service outlets installed, but no fewer than two .

PART 2 - PRODUCTS

2.1 GENERAL WIRING-DEVICE REQUIREMENTS

- A. Wiring Devices, Components, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.
- B. Comply with NFPA 70.
- C. RoHS compliant.
- D. Comply with NEMA WD 1 and NEMA WD 6.
- E. Devices indicated as "tamper-resistant" shall have integral shutters that operate only when both prongs of a plug are inserted in the receptacle.
- F. Devices indicated as "weather-proof" or "weather-resistant" shall have the following:
 - 1. Spring-loaded, gasketed, "weather-proof-in-use" cover.
 - 2. Marking: Listed and labeled as complying with NFPA 70, "Receptacles in Damp or Wet Locations" Article.
- G. Switches indicated as Key-switch shall have factory-supplied key in lieu of switch handle.
- H. Devices indicated or specified as anti-microbial shall have contact surfaces treated with a factory-applied coating that kills 99.9 percent of certain common bacteria within two hours when regularly and properly cleaned.

- I. Devices indicated or specified as decorator style shall have a rectangular face opening.
- J. Devices for Owner-Furnished Equipment:
 - 1. Receptacles: Match plug configurations.
 - 2. Cord and Plug Sets: Match equipment requirements.
- K. Device Color:
 - 1. Wiring Devices Connected to Normal Power System: As selected by Architect unless otherwise indicated or required by NFPA 70 or device listing.
 - 2. Wiring Devices Connected to Emergency Electrical System: Red.
 - 3. SPD Devices: Blue.
 - 4. Isolated-Ground Receptacles: Orange.
- L. Source Limitations: Obtain each type of wiring device and associated wall plate from single source from single manufacturer.

2.2 STANDARD RECEPTACLES, 125 V, 20 A

- A. Duplex Receptacles, 125 V, 20 A:
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton (Arrow Hart).
 - b. Hubbell Incorporated; Wiring Device-Kellems.
 - c. Leviton Manufacturing Co., Inc.
 - d. Pass & Seymour/Legrand (Pass & Seymour).
 - 2. Description: Two pole, three wire, and self-grounding.
 - 3. Configuration: Heavy-duty, NEMA 5-20R
 - 4. Standards: Comply with UL 498 and FS W-C-596.
- B. Isolated-Ground Duplex Receptacles, 125 V, 20 A:
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton (Arrow Hart).
 - b. Hubbell Incorporated; Wiring Device-Kellems.
 - c. Leviton Manufacturing Co., Inc.
 - d. Pass & Seymour/Legrand (Pass & Seymour).
 - 2. Description: Straight blade; equipment grounding contacts shall be connected only to green grounding screw terminal of the device and with inherent electrical isolation from mounting strap. Isolation shall be integral to receptacle construction and not dependent on removable parts. Two pole, three wire, and self-grounding.
 - 3. Configuration: Heavy-duty, NEMA 5-20R
 - 4. Standards: Comply with UL 498 and FS W-C-596.

2.3 USB RECEPTACLES

- A. USB Charging Receptacles:
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton (Arrow Hart).
 - b. Hubbell Incorporated; Wiring Device-Kellems.
 - c. Leviton Manufacturing Co., Inc.
 - d. Pass & Seymour/Legrand (Pass & Seymour).
 - 2. Description:

- a. Receptacle: Duplex 20A, 125V receptacle, configuration 5-20R, with tamper-resistant shutters.
 - b. USB Ports: One USB Type A and one USB Type C port with total available charging current of 3.1A or greater at 5 VDC.
3. Standards: Comply with UL 498, UL 1310 and USB 3.0 devices.

2.4 GFCI RECEPTACLES, 125 V, 20 A

- A. Duplex GFCI Receptacles, 125 V, 20 A:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton (Arrow Hart).
 - b. Hubbell Incorporated; Wiring Device-Kellems.
 - c. Leviton Manufacturing Co., Inc.
 - d. Pass & Seymour/LeGrand (Pass & Seymour).
 2. Description: Integral GFCI with "Test" and "Reset" buttons and LED indicator light. Two pole, three wire, and self-grounding.
 3. Configuration: NEMA WD 6, Configuration 5-20R.
 4. Type: Non-feed through.
 5. Standards: Comply with UL 498, UL 943 Class A, and FS W-C-596.

2.5 CONTROLLED RECEPTACLES, 125 V, 20 A

- A. Duplex Controlled Receptacle, 125 V, 20 A:
1. Description: Receptacle marked with the controlled receptacle symbol as required by NFPA 70 article 406.
 2. Configuration: Heavy-duty, NEMA WD 6, Configuration 5-20R.
 3. Receptacle Type: Standard, USB, GFCI, tamper-resistant, hospital-grade, or any combination thereof as required to meet the requirements of this Section pertaining to where specific receptacle types are required, or as specifically indicated on Drawings.
 4. Switching Configuration: Half-controlled or full controlled as indicated on Drawings.

2.6 TWIST-LOCKING RECEPTACLES

- A. Single Convenience Receptacles, amperage, voltage, and NEMA configuration as indicated on the Drawings: Comply with NEMA WD 1 and UL 498.
1. Products: Subject to compliance with the requirements, provide products by one of the following manufacturers:
 - a. Cooper
 - b. Hubbell
 - c. Leviton
 - d. Pass & Seymour

2.7 CORD AND PLUG SETS

- A. Match voltage and current ratings and number of conductors to requirements of equipment being connected.
- B. Cord: Rubber-insulated, stranded-copper conductors, with Type SOW-A jacket; with green-insulated grounding conductor and ampacity of at least 130 percent of the equipment rating.
- C. Plug: Nylon body and integral cable-clamping jaws. Match cord and receptacle type for connection.

2.8 TOGGLE SWITCHES, 120/277 V, 20 A

- A. Snap Switches, 120/277 V, 20 A :
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton (Arrow Hart).
 - b. Hubbell Incorporated; Wiring Device-Kellems.
 - c. Leviton Manufacturing Co., Inc.
 - d. Pass & Seymour/Legrand (Pass & Seymour).
 2. Standards: Comply with UL 20 and FS W-S-896.
- B. Pilot-Light, Snap Switches: 120/277 V, 20 A:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton (Arrow Hart).
 - b. Hubbell Incorporated; Wiring Device-Kellems.
 - c. Leviton Manufacturing Co., Inc.
 - d. Pass & Seymour/Legrand (Pass & Seymour).
 2. Description: Illuminated when switch is [on] [off].
 3. Standards: Comply with UL 20 and FS W-S-896.
- C. Lighted Snap Switches, 120/277 V, 20 A:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton (Arrow Hart).
 - b. Hubbell Premise Wiring.
 - c. Leviton Manufacturing Co., Inc.
 - d. Pass & Seymour/Legrand (Pass & Seymour).
 2. Description: Handle illuminated when switch is [on] [off].
 3. Standards: Comply with NEMA WD 1, UL 20, and FS W-S-896.

2.9 DIMMERS

- A. Wall-Box Dimmers:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton (Arrow Hart).
 - b. Hubbell Incorporated; Wiring Device-Kellems.
 - c. Leviton Manufacturing Co., Inc.
 - d. Lutron Electronics Co., Inc.
 - e. Pass & Seymour/Legrand (Pass & Seymour).
 2. Description: Modular, full-wave, solid-state dimmer switch with integral, quiet on-off switches, with audible frequency and EMI/RFI suppression filters.
 3. Control: Continuously adjustable slider; with single-pole or three-way switching.
 4. Standards: Comply with UL 1472.
 5. LED Lamp Dimmer Switches: Modular; compatible with LED lamps; trim potentiometer to adjust low-end dimming; capable of consistent dimming with low end not greater than 20 percent of full brightness.

2.10 WALL PLATES

- A. Single Source: Obtain wall plates from same manufacturer of wiring devices.
- B. Single and combination types shall match corresponding wiring devices.

1. Plate-Securing Screws: Metal with head color to match plate finish.
2. Material for Finished Spaces: Steel with white baked enamel, suitable for field painting 0.035-inch-thick, satin-finished, Type 302 stainless steel. Material for Unfinished Spaces: Galvanized steel.
3. Material for Damp Locations: Thermoplastic with spring-loaded lift cover, and listed and labeled for use in wet and damp locations.

- C. Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with Type 3R, weather-resistant, die-cast aluminum with lockable cover.

2.11 FLOOR SERVICE FITTINGS

- A. Flush-Type Floor Service Fittings:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton (Arrow Hart).
 - b. Hubbell Premise Wiring.
 - c. ABB (Electrification Products Division).
 - d. Wiremold / Legrand.
2. Description: Type: Modular, flush-type, dual-service units suitable for wiring method used, with cover flush with finished floor.
3. Compartments: Barrier separates power from voice and data communication cabling.
4. Service Plate and Cover: Rectangular, die-cast aluminum with satin finish.
5. Power Receptacle: NEMA WD 6 Configuration 5-20R, gray finish, unless otherwise indicated.
6. Data Communication Outlet: Blank cover with bushed cable opening.

- B. Flap-Type Service Fittings:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton (Arrow Hart).
 - b. Hubbell Premise Wiring.
 - c. ABB (Electrification Products Division).
 - d. Wiremold / Legrand.
2. Description: Type: Modular, flap-type, dual-service units suitable for wiring method used, with flaps flush with finished floor.
3. Compartments: Barrier separates power from voice and data communication cabling.
4. Flaps: Rectangular die-cast aluminum with satin finish.
5. Service Plate: Same finish as flaps.
6. Power Receptacle: NEMA WD 6 Configuration 5-20R, gray finish, unless otherwise indicated.
7. Data Communication Outlet: Blank cover with bushed cable opening.

- C. Above-Floor Service Fittings:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eaton (Arrow Hart).
 - b. Hubbell Premise Wiring.
 - c. ABB (Electrification Products Division).
 - d. Wiremold / Legrand.
2. Description: Type: Modular, above-floor, dual-service units suitable for wiring method used.
3. Compartments: Barrier separates power from voice and data communication cabling.
4. Power Receptacle: NEMA WD 6 Configuration 5-20R, gray finish, unless otherwise indicated.

2.12 Data Communication Outlet: Blank cover with bushed cable opening.FLOOR BOXES

- A. Description: Floor-mounted box with cover enclosing multiple outlets in a single assembly.
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. ABB (Electrification Products Division).
 2. Wiremold; Legrand North America, LLC.
 3. Wiring Device-Kellems; Hubbell Incorporated, Commercial and Industrial.
- C. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 by qualified electrical testing laboratory recognized by authorities having jurisdiction and marked for intended location and application.
- D. General Characteristics:
1. Reference Standards: UL 514A for metallic boxes; UL 514C for nonmetallic boxes, including scrub-water exclusion requirements; and UL 514D for cover plates.
 2. Provide separate paths for management of telecommunications and power cables in accordance with NFPA 76.
 3. Compartments: Barrier separates power from voice and data communication cabling.
 4. Concrete Floor Boxes:
 - a. Provide floor boxes classified for use in fire rated concrete floors. Match floor box fire rating to floor assembly. Boxes indicated in floors in contact with the earth must be protected by epoxy paint or must be made of a suitable material to prevent oxidation and deterioration such as cast iron.
 - b. Floor boxes must provide a minimum of four inches of adjustment prior to concrete pour and a minimum of 1/2 inch after concrete is set.
- E. Source Limitations: Obtain products from single manufacturer designed for use as complete, matching assembly of raceways and receptacles.
- F. Floor Box Type FB1:
1. Description: Recessed 2-compartment power floor box.
 - a. Compartment 1: 20-ampere, 125-volt duplex receptacle.
 - b. Compartment 2: 20-ampere, 125-volt duplex receptacle.
- G. Floor Box Type FB2:
1. Description: Recessed 4-compartment power and telecommunications floor box
 - a. Compartment 1: 20-ampere, 125-volt duplex receptacle.
 - b. Compartment 2: 20-ampere, 125-volt duplex receptacle.
 - c. Compartment 3: Communication bracket with four knockouts which accept standard RJ type keystone jacks.
- H. Floor Box Type FB3:
1. Description: Recessed 6-compartment power/telecommunications/AV floor box.
 - a. Compartment 1: 20-ampere, 125-volt duplex receptacle.
 - b. Compartment 2: 20-ampere, 125-volt duplex receptacle.
 - c. Compartment 3: Communication bracket with four knockouts which accept standard RJ type keystone jacks.
- I. Covers: Flanged cover for use in tile or carpet, with brushed cable pass-through.
1. Finish: Black.
- 2.13 POKE-THRU ASSEMBLIES**
- A. Description: Factory-fabricated assembly of below-floor junction box with multichannel, through-floor raceway/firestop unit with receptacles or communications outlets installed below floor surface level.
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. ABB (Electrification Products Division).
 2. Wiremold; Legrand North America, LLC.
 3. Wiring Device-Kellems; Hubbell Incorporated, Commercial and Industrial.
- C. Regulatory Requirements: Listed and labeled in accordance with NFPA 70 by qualified electrical testing laboratory recognized by authorities having jurisdiction and marked for intended location and application.
- D. General Characteristics:
1. Reference Standards: UL 514A for metallic boxes and UL 514C for nonmetallic boxes, including scrub-water exclusion requirements.
 2. Provide separate paths for management of telecommunications and power cables.
 3. Fire Rating: Provide unit listed and labeled for fire rating of floor-ceiling assembly.
- E. Source Limitations: Obtain products from single manufacturer designed for use as complete, matching assembly of raceways and receptacles.
- F. Poke-Through Type PT1:
1. Service Outlet Assembly: Flush type with two simplex receptacles.
 2. Core Size: Selected to fit nominal 4-inch cored holes in floor and matched to floor thickness.
- G. Poke-Through Type PT2:
1. Service Outlet Assembly: Recessed type with two 20-ampere, 125-volt duplex receptacles and a modular low voltage section capable of accepting low voltage connectors. Provide RJ-45 jack quantities as required to accommodate the quantity of data cables indicated on the Drawings. Where specific data cable quantities are not indicated, provide two RJ-45 connectors.
 2. Core size: Selected to fit nominal 6-inch cored holes in floor and matched to floor thickness.
- H. Poke-Through Type PT3:
1. Service Outlet Assembly: Flush type with connectors for flexible conduit connections for power and telecommunications service to furniture systems.
- I. Covers: Flanged for use in tile or carpet.
1. Finish: As Selected by Architect.

2.14 SURFACE RACEWAYS

- A. Description: Two-piece, aluminum construction multioutlet assembly with brushed natural or satin anodized natural finish with devices, junction fittings, and other matching accessories as required for a complete system and per UL 5.
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Hubbell Incorporated; Wiring Device-Kellems.
 2. Wiremold / Legrand.
 3. MonoSystems, Inc.
- C. General:
1. Components shall be products from single manufacturer designed for use as a complete, matching assembly of raceways and receptacles.
 2. Provide continuous one-piece cover plates, minimum four feet long.
 3. Provide GFCI receptacles for sections of multioutlet assemblies that are indicated within 6'-0" of the edge of a sink.
 4. Wiring: Minimum no. 12 AWG solid, Type THHN copper. Provide larger conductor sizes where receptacles with ampacities greater than 20-amperes are indicated.

- D. Surface Raceway Type SR-1
 - 1. Multioutlet assembly with prewired, 20-ampere, 125-volt, 2-pole, 3-wire duplex receptacles on 18-inch centers, alternately connected to one 20-ampere circuits, 120-volt circuits with ground.
 - 2. Receptacle Finish: Grey

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Comply with NECA 1, including mounting heights listed in that standard, unless otherwise indicated.
- B. Coordination with Other Trades:
 - 1. Protect installed devices and their boxes. Do not place wall finish materials over device boxes, and do not cut holes for boxes with routers that are guided by riding against outside of boxes.
 - 2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.
 - 3. Install device boxes in brick or block walls so that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.
 - 4. Install wiring devices after all wall preparation, including painting, is complete.
- C. Conductors:
 - 1. Do not strip insulation from conductors until right before they are spliced or terminated on devices.
 - 2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
 - 3. The length of free conductors at outlets for devices shall comply with NFPA 70, Article 300, without pigtails.
 - 4. Existing Conductors:
 - a. Cut back and pigtail, or replace all damaged conductors.
 - b. Straighten conductors that remain and remove corrosion and foreign matter.
 - c. Pigtailing existing conductors is permitted, provided the outlet box is large enough.
- D. Device Installation:
 - 1. Replace devices that have been in temporary use during construction and that were installed before building finishing operations were complete.
 - 2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
 - 3. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.
 - 4. Connect devices to branch circuits using pigtails that are not less than 6 inches in length.
 - 5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, two-thirds to three-fourths of the way around terminal screw.
 - 6. Use a torque screwdriver when a torque is recommended or required by manufacturer.
 - 7. When conductors larger than No. 12 AWG are installed on 15- or 20-A circuits, splice No. 12 AWG pigtails for device connections.
 - 8. Tighten unused terminal screws on the device.
 - 9. When mounting into metal boxes, remove the fiber or plastic washers used to hold device-mounting screws in yokes, allowing metal-to-metal contact.
- E. Receptacle Type:
 - 1. Install GFCI receptacles for all receptacles supplied by single-phase branch circuits rated 150V or less to ground in the following spaces/locations:
 - a. Bathrooms.
 - b. Kitchens or similar areas with a sink and permanent provisions for either food preparation or cooking.

- c. Buffet serving areas with permanent provisions for food serving, beverage serving, or cooking.
 - d. Where the receptacle is installed within 6 feet of the edge of a sink.
 - e. Outdoors.
 - f. Indoor damp and wet locations.
 - g. Locker rooms with associated showering facilities.
 - h. Garages, accessory buildings, service bays, and similar areas.
 - i. Laundry areas.
2. Install GFCI receptacles at the following equipment supplied by single-phase branch circuits rated 150V or less to ground and 60 amperes:
- a. Automotive vacuum machines
 - b. Drinking water coolers and bottle fill stations
 - c. High-pressure spray washing machines
 - d. Tire inflation machines
 - e. Vending machines
 - f. Sump pumps
 - g. Dishwashers
 - h. Electric Ranges
 - i. Wall-mounted ovens
 - j. Counter-mounted cooking units
 - k. Clothes dryers
 - l. Microwave ovens
3. Where GFCI receptacles cannot be installed in a readily accessible location or are not available in the receptacle configuration required to serve a specific load, provide equivalent ground fault circuit interrupter protection by installing a GFCI type circuit breaker as the branch circuit overcurrent protective device for the load.
4. Install tamper-resistant versions of the specified receptacles for all 20A, 125V and 250V nonlocking-type receptacles in the following areas:
- a. All spaces in educational facilities.
 - b. Business offices, corridors, waiting rooms, and similar spaces in clinics, medical and dental offices, and outpatient healthcare facilities.
 - c. Dormitory units.
 - d. Gymnasiums.
 - e. Auditoriums.
 - f. All spaces in assisted living facilities.
- F. Receptacle Orientation:
- 1. Install ground pin of vertically mounted receptacles up, and on horizontally mounted receptacles to the right.
- G. Device Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.
- H. Dimmers:
- 1. Install dimmers within terms of their listing.
 - 2. Verify that dimmers used for fan-speed control are listed for that application.
 - 3. Install unshared neutral conductors on line and load side of dimmers according to manufacturers' device, listing conditions in the written instructions.
- I. Arrangement of Devices: Unless otherwise indicated, mount flush, with long dimension vertical and with grounding terminal of receptacles on top. Group adjacent switches under single, multigang wall plates.
- J. Adjust locations of floor service outlets and service poles to suit arrangement of partitions and furnishings.

- K. Floor boxes and poke-thru assemblies: For each floor box and poke-thru with communications devices or provisions, provide a conduit stubbed into the accessible ceiling space above the room served by the floor mounted device. Stubbing conduits into the ceiling space below is not permitted.

3.2 IDENTIFICATION

- A. Comply with Section 260553 "Identification for Electrical Systems."
- B. Identify each wiring device with panelboard identification and circuit number. In spaces where low voltage lighting control wall stations are utilized, identify panelboard and circuit number of the lights controlled by the low voltage device. In spaces with multiple lighting circuits, provide multiple tables to indicate each lighting branch circuit serving the space. Use hot, stamped, or engraved machine printing with black-filled lettering on front face of plate, and durable wire markers or tags inside outlet boxes.

3.3 FIELD QUALITY CONTROL

- A. Test Instruments: Use instruments that comply with UL 1436.
- B. Test Instrument for Receptacles: Digital wiring analyzer with digital readout or illuminated digital-display indicators of measurement.
- C. Tests for Receptacles:
 - 1. Line Voltage: Acceptable range is 105 to 132 V.
 - 2. Percent Voltage Drop under 15-A Load: A value of 6 percent or higher is unacceptable.
 - 3. Ground Impedance: Values of up to 2 ohms are acceptable.
 - 4. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.
 - 5. Using the test plug, verify that the device and its outlet box are securely mounted.
 - 6. Tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault-current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.
- D. Wiring device will be considered defective if it does not pass tests and inspections.
- E. Prepare test and inspection reports.

END OF SECTION 262726

SECTION 262813 - FUSES

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Cartridge fuses rated 600 V ac and less for use in the following:
 - a. Enclosed switches.

1.2 ACTION SUBMITTALS

- A. Product Data: For each type of product. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for spare-fuse cabinets. Include the following for each fuse type indicated:
 - 1. Dimensions and manufacturer's technical data on features, performance, electrical characteristics, and ratings.

1.3 FIELD CONDITIONS

- A. Where ambient temperature to which fuses are directly exposed is less than 40 deg F or more than 100 deg F, apply manufacturer's ambient temperature adjustment factors to fuse ratings.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by the following:
 - 1. Bussmann, an Eaton business.
 - 2. Edison; a brand of Bussmann by Eaton.
 - 3. Littelfuse, Inc.
 - 4. Mersen USA.
- B. Source Limitations: Obtain fuses, for use within a specific product or circuit, from single source from single manufacturer.

2.2 CARTRIDGE FUSES

- A. Characteristics: NEMA FU 1, current-limiting, nonrenewable cartridge fuses with voltage ratings consistent with circuit voltages.
 - 1. Type RK-1: 600-V, zero- to 600-A rating, 200 kAIC, time delay.
 - 2. Type RK-5: 600-V, zero- to 600-A rating, 200 kAIC, time delay.
 - 3. Type CC: 600-V, zero- to 30-A rating, 200 kAIC, time delay.
 - 4. Type CD: 600-V, 31- to 60-A rating, 200 kAIC, time delay.
 - 5. Type J: 600-V, zero- to 600-A rating, 200 kAIC, time delay.
 - 6. Type L: 600-V, 601- to 6000-A rating, 200 kAIC, time delay.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with NEMA FU 1 for cartridge fuses.

- D. Comply with NFPA 70.
- E. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size and with system short-circuit current levels.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine fuses before installation. Reject fuses that are moisture damaged or physically damaged.
- B. Examine holders to receive fuses for compliance with installation tolerances and other conditions affecting performance, such as rejection features.
- C. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.
- D. Evaluate ambient temperatures to determine if fuse rating adjustment factors must be applied to fuse ratings.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install fuses in fusible devices. Arrange fuses so rating information is readable without removing fuse.
- B. Install spare-fuse cabinet(s) in location shown on the Drawings or as indicated in the field by Construction Manager.

3.3 IDENTIFICATION

- A. Install labels complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems" and indicating fuse replacement information inside of door of each fused switch and adjacent to each fuse block, socket, and holder.

END OF SECTION 262813

SECTION 262816 - ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.1 ACTION SUBMITTALS

- A. Product Data: For each type of enclosed switch, circuit breaker, accessory, and component indicated. Include nameplate ratings, dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.
- B. Shop Drawings: For enclosed switches and circuit breakers.
 - 1. Include plans, elevations, sections, details, and attachments to other work.
 - 2. Include wiring diagrams for power, signal, and control wiring.

1.2 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified testing agency.
- B. Seismic Qualification Certificates: For enclosed switches and circuit breakers, accessories, and components, from manufacturer.
- C. Field quality-control reports.

1.3 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.4 QUALITY ASSURANCE

- A. Testing Agency Qualifications: Accredited by NETA.
 - 1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Enclosed switches and circuit breakers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - 1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2.2 GENERAL REQUIREMENTS

- A. Source Limitations: Obtain enclosed switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single manufacturer.
- B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for enclosed switches and circuit breakers, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum dimensions.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

- D. Comply with NFPA 70.

2.3 FUSIBLE AND NONFUSIBLE SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Eaton.
 2. ABB.
 3. Siemens Industry, Inc.
 4. Square D; by Schneider Electric.
- B. Type HD, Heavy Duty:
1. Single throw.
 2. Three pole, unless otherwise indicated.
 3. 240 or 600-V ac.
 4. Ampacity as indicated or scheduled.
 5. UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified or indicated fuses.
 6. Lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- C. Accessories:
1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
 2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
 3. Isolated Ground Kit: Internally mounted; insulated, labeled for copper and aluminum neutral conductors.
 4. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
 5. Arc-Energy Reduction Relay: For switches rated 1200A, provide internally mounted device compliant with NFPA 70 article 240.67 requirements, with external display containing pushbutton and visual indicator for maintenance mode.
 6. Hookstick Handle: Allows use of a hookstick to operate the handle.
 7. Lugs: Mechanical type, suitable for number, size, and conductor material.
 8. Service-Rated Switches: Labeled for use as service equipment.

2.4 RECEPTACLE SWITCHES

- A. Same as specified for fusible and nonfusible switches plus the following:
1. Interlocking Linkage: Provided between the receptacle and switch mechanism to prevent inserting or removing plug while switch is in the on position, inserting any plug other than specified, and turning switch on if an incorrect plug is inserted or correct plug has not been fully inserted into the receptacle.
 2. Receptacle: Polarized, three-phase, four-wire receptacle (fourth wire connected to enclosure ground lug).

2.5 MOLDED-CASE CIRCUIT BREAKERS

- A. Manufacturers: Subject to compliance with requirements, [provide products by one of the following] :
1. Eaton.
 2. ABB.
 3. Siemens Industry, Inc.
 4. Square D; by Schneider Electric.
- B. Circuit breakers shall be constructed using glass-reinforced insulating material. Current carrying components shall be completely isolated from the handle and the accessory mounting area.

- C. Circuit breakers shall have a toggle operating mechanism with common tripping of all poles, which provides quick-make, quick-break contact action. The circuit-breaker handle shall be over center, be trip free, and reside in a tripped position between on and off to provide local trip indication. Circuit-breaker escutcheon shall be clearly marked on and off in addition to providing international I/O markings. Equip circuit breaker with a push-to-trip button, located on the face of the circuit breaker to mechanically operate the circuit-breaker tripping mechanism for maintenance and testing purposes.
- D. The maximum ampere rating and UL, IEC, or other certification standards with applicable voltage systems and corresponding interrupting ratings shall be clearly marked on face of circuit breaker. Circuit breakers shall be 100 percent rated. Fuse/circuit breaker combinations for series connected interrupting ratings shall be listed by UL as recognized component combinations. Any series rated combination used shall be marked on the end-use equipment along with the statement "Caution - Series Rated System. _____ Amps Available. Identical Replacement Component Required."
- E. MCCBs shall be equipped with a device for locking in the isolated position.
- F. Lugs shall be suitable for 194 deg F rated wire, sized according to the 167 deg F temperature rating in NFPA 70.
- G. Standards: Comply with UL 489 and NEMA AB 3, with interrupting capacity to comply with available fault currents.
- H. Thermal-Magnetic Circuit Breakers: Inverse time-current thermal element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
- I. Adjustable, Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
- J. Electronic Trip Circuit Breakers: Field-replaceable rating plug, rms sensing, with the following field-adjustable settings:
- K. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller, and let-through ratings less than NEMA FU 1, RK-5.
- L. Features and Accessories:
 - 1. Standard frame sizes, trip ratings, and number of poles.
 - 2. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge lighting circuits.
 - 3. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact.
 - 4. Auxiliary Contacts: One SPDT switch with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.
 - 5. Alarm Switch: One NO contact that operates only when circuit breaker has tripped.
 - 6. Arc-Energy Reduction: For circuit breakers rated 1200A or greater, provide circuit breaker compliant with NFPA 70 article 240.87 requirements, with external display containing pushbutton and visual indicator for maintenance mode.

2.6 ENCLOSURES

- A. Enclosed Switches and Circuit Breakers: UL 489, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.
- B. Enclosure Finish: The enclosure shall be gray baked enamel paint, electrodeposited on cleaned, phosphatized steel (NEMA 250 Type 1); gray baked enamel paint, electrodeposited on cleaned, phosphatized galvanized steel (NEMA 250 Types 3R, 12); a brush finish on Type 304 stainless steel (NEMA 250 Type 4-4X stainless steel); copper-free cast aluminum alloy (NEMA 250 Types 7, 9).

- C. Conduit Entry: NEMA 250 Types 4, 4X, and 12 enclosures shall contain no knockouts. NEMA 250 Types 7 and 9 enclosures shall be provided with threaded conduit openings in both endwalls.
- D. Operating Mechanism: The circuit-breaker operating handle shall be [directly operable through the front cover of the enclosure (NEMA 250 Type 1); directly operable through the dead front trim of the enclosure (NEMA 250 Type 3R); externally operable with the operating mechanism being an integral part of the cover (NEMA 250 Types 7, 9). The cover interlock mechanism shall have an externally operated override. The override shall not permanently disable the interlock mechanism, which shall return to the locked position once the override is released. The tool used to override the cover interlock mechanism shall not be required to enter the enclosure in order to override the interlock.
- E. Enclosures designated as NEMA 250 Type 4, 4X stainless steel, 12, or 12K shall have a dual cover interlock mechanism to prevent unintentional opening of the enclosure cover when the circuit breaker is ON and to prevent turning the circuit breaker ON when the enclosure cover is open.
- F. NEMA 250 Type 7/9 enclosures shall be furnished with a breather and drain kit to allow their use in outdoor and wet location applications.

PART 3 - EXECUTION

3.1 ENCLOSURE ENVIRONMENTAL RATING APPLICATIONS

- A. Enclosed Switches and Circuit Breakers: Provide enclosures at installed locations with the following environmental ratings.
 - 1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.
 - 2. Outdoor Locations: NEMA 250, Type 3R.
 - 3. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.

3.2 INSTALLATION

- A. Coordinate layout and installation of switches, circuit breakers, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.
- C. Comply with mounting and anchoring requirements specified in Section 260548.16 "Seismic Controls for Electrical Systems."
- D. Temporary Lifting Provisions: Remove temporary lifting of eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- E. Install fuses in fusible devices.
- F. Comply with NFPA 70 and NECA 1.
- G. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573 "Power System Studies."
- H. Where motor disconnect switches are installed downstream of a variable frequency drive (VFD), provide 2#12 AWG conductors from the disconnect switch to the VFD. Terminate wiring in disconnect switch at early break auxiliary contacts and coordinate programming and terminating of conductors at VFD with VFD installer.

3.3 IDENTIFICATION

- A. Comply with requirements in Section 260553 "Identification for Electrical Systems."
 - 1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
 - 2. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.4 FIELD QUALITY CONTROL

- A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.
- B. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- C. Perform tests and inspections.
- D. Tests and Inspections for Switches:
 - 1. Visual and Mechanical Inspection:
 - a. Inspect physical and mechanical condition.
 - b. Inspect anchorage, alignment, grounding, and clearances.
 - c. Verify that the unit is clean.
 - d. Verify blade alignment, blade penetration, travel stops, and mechanical operation.
 - e. Verify that fuse sizes and types match the Specifications and Drawings.
 - f. Verify that each fuse has adequate mechanical support and contact integrity.
 - g. Inspect bolted electrical connections for high resistance using one of the two following methods:
 - 1) Use a low-resistance ohmmeter.
 - a) Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.
 - 2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS Table 100.12.
 - a) Bolt-torque levels shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS Table 100.12.
 - h. Verify that operation and sequencing of interlocking systems is as described in the Specifications and shown on the Drawings.
 - i. Verify correct phase barrier installation.
 - j. Verify lubrication of moving current-carrying parts and moving and sliding surfaces.
 - 2. Electrical Tests:
 - a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter. Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.
 - b. Measure contact resistance across each switchblade fuseholder. Drop values shall not exceed the high level of the manufacturer's published data. If manufacturer's published data are not available, investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.
 - c. Perform insulation-resistance tests for one minute on each pole, phase-to-phase and phase-to-ground with switch closed, and across each open pole. Apply voltage in accordance with manufacturer's published data. In the absence of manufacturer's published data, use Table 100.1 from the NETA ATS. Investigate values of insulation resistance less than those published in Table 100.1 or as recommended in manufacturer's published data.

- d. Measure fuse resistance. Investigate fuse-resistance values that deviate from each other by more than 15 percent.
 - e. Perform ground fault test according to NETA ATS 7.14 "Ground Fault Protection Systems, Low-Voltage."
- E. Tests and Inspections for Molded Case Circuit Breakers:
- 1. Visual and Mechanical Inspection:
 - a. Verify that equipment nameplate data are as described in the Specifications and shown on the Drawings.
 - b. Inspect physical and mechanical condition.
 - c. Inspect anchorage, alignment, grounding, and clearances.
 - d. Verify that the unit is clean.
 - e. Operate the circuit breaker to ensure smooth operation.
 - f. Inspect bolted electrical connections for high resistance using one of the two following methods:
 - 1) Use a low-resistance ohmmeter.
 - a) Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.
 - 2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS Table 100.12.
 - a) Bolt-torque levels shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS Table 100.12.
 - g. Inspect operating mechanism, contacts, and chutes in unsealed units.
 - h. Perform adjustments for final protective device settings in accordance with the coordination study.
 - 2. Electrical Tests:
 - a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter. Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.
 - b. Perform insulation-resistance tests for one minute on each pole, phase-to-phase and phase-to-ground with circuit breaker closed, and across each open pole. Apply voltage in accordance with manufacturer's published data. In the absence of manufacturer's published data, use Table 100.1 from the NETA ATS. Investigate values of insulation resistance less than those published in Table 100.1 or as recommended in manufacturer's published data.
 - c. Perform a contact/pole resistance test. Drop values shall not exceed the high level of the manufacturer's published data. If manufacturer's published data are not available, investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.
 - d. Perform insulation resistance tests on all control wiring with respect to ground. Applied potential shall be 500-V dc for 300-V rated cable and 1000-V dc for 600-V rated cable. Test duration shall be one minute. For units with solid state components, follow manufacturer's recommendation. Insulation resistance values shall be no less than two megohms.
 - 3. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 - 4. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- F. Prepare test and inspection reports.
- 1. Test procedures used.

2. Include identification of each enclosed switch and circuit breaker tested and describe test results.
3. List deficiencies detected, remedial action taken, and observations after remedial action.

END OF SECTION 262816

SECTION 262923 - VARIABLE-FREQUENCY MOTOR CONTROLLERS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes separately enclosed, preassembled, combination VFCs, rated 600 V and less, for speed control of three-phase, squirrel-cage induction motors.

1.2 DEFINITIONS

- A. CE: Conformance Europeene (European Compliance).
- B. CPT: Control power transformer.
- C. DDC: Direct digital control.
- D. EMI: Electromagnetic interference.
- E. LED: Light-emitting diode.
- F. NC: Normally closed.
- G. NO: Normally open.
- H. OCPD: Overcurrent protective device.
- I. PID: Control action, proportional plus integral plus derivative.
- J. RFI: Radio-frequency interference.
- K. VFC: Variable-frequency motor controller, also known as Variable frequency drive (VFD)

1.3 ACTION SUBMITTALS

- A. Product Data: For each type and rating of VFC indicated.
 - 1. Include dimensions and finishes for VFCs.
 - 2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- B. Shop Drawings: For each VFC indicated.
 - 1. Include mounting and attachment details.
 - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Floor plans, drawn to scale, showing dimensioned layout on which the following items are shown and coordinated with each other, using input from installers of the items involved:
 - 1. Required working clearances and required area above and around VFCs.
 - 2. Show VFC layout and relationships between electrical components and adjacent structural and mechanical elements.
 - 3. Show support locations, type of support, and weight on each support.

4. Indicate field measurements.
- B. Qualification Data: For testing agency.
- C. Seismic Qualification Data: Certificates, for each VFC, accessories, and components, from manufacturer.
 1. Certificate of compliance.
 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 3. Detailed description of equipment anchorage devices on which the certification is based, and their installation requirements.
- D. Product Certificates: For each VFC from manufacturer.
- E. Field quality-control reports.
- F. Sample Warranty: For special warranty.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For VFCs to include in emergency, operation, and maintenance manuals.
 1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:
 - a. Manufacturer's written instructions for testing and adjusting thermal-magnetic circuit breaker and motor-circuit protector trip settings.
 - b. Manufacturer's written instructions for setting field-adjustable overload relays.
 - c. Manufacturer's written instructions for testing, adjusting, and reprogramming microprocessor control modules.
 - d. Manufacturer's written instructions for setting field-adjustable timers, controls, and status and alarm points.

1.6 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
 2. Control Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
 3. Indicating Lights: Two of each type and color installed.
 4. Auxiliary Contacts: Furnish one spare(s) for each size and type of magnetic controller installed.
 5. Power Contacts: Furnish three spares for each size and type of magnetic contactor installed.

1.7 QUALITY ASSURANCE

- A. Testing Agency Qualifications: Accredited by NETA.
 1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. If stored in space that is not permanently enclosed and air conditioned, remove loose packing and flammable materials from inside controllers and install temporary electric heating, with at least 250 W per controller.

- B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for VFCs, including clearances between VFCs, and adjacent surfaces and other items.

1.9 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace VFCs that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by the following:
 - 1. ABB Low Voltage HVAC Drives.
 - 2. Danfoss Inc.
 - 3. Eaton.
 - 4. SIEMENS Industry, Inc.; Energy Management Division.
 - 5. Yaskawa Electric America, Inc.
 - 6. Or equal.

2.2 SYSTEM DESCRIPTION

- A. General Requirements for VFCs:
 - 1. VFCs and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 - 2. Comply with NEMA ICS 7, NEMA ICS 61800-2, and UL 61800-5-1.
- B. Application: variable torque.
- C. VFC Description: Variable-frequency motor controller, consisting of power converter that employs pulse-width-modulated inverter, factory built and tested in an enclosure, with integral disconnecting means and overcurrent and overload protection; listed and labeled by an NRTL as a complete unit; arranged to provide self-protection, protection, and variable-speed control of one or more three-phase induction motors by adjusting output voltage and frequency.
 - 1. Units suitable for operation of NEMA MG 1, Design A and Design B motors, as defined by NEMA MG 1, Section IV, Part 30, "Application Considerations for Constant Speed Motors Used on a Sinusoidal Bus with Harmonic Content and General Purpose Motors Used with Adjustable-Voltage or Adjustable-Frequency Controls or Both."
 - 2. Units suitable for operation of inverter-duty motors as defined by NEMA MG 1, Section IV, Part 31, "Definite-Purpose Inverter-Fed Polyphase Motors."
 - 3. Listed and labeled for integrated short-circuit current (withstand) rating by an NRTL acceptable to authorities having jurisdiction.
- D. Design and Rating: Match load type, such as fans, blowers, and pumps; and type of connection used between motor and load such as direct or through a power-transmission connection.
- E. Output Rating: Three phase; 10 to 60 Hz, with voltage proportional to frequency throughout voltage range; maximum voltage equals input voltage.
- F. Unit Operating Requirements:
 - 1. Input AC Voltage Tolerance: Plus 10 and minus 10 percent of VFC input voltage rating.
 - 2. Input AC Voltage Unbalance: Not exceeding 3 percent.

3. Input Frequency Tolerance: Plus or minus 3 percent of VFC frequency rating.
 4. Minimum Efficiency: 96 percent at 60 Hz, full load.
 5. Minimum Displacement Primary-Side Power Factor: 96 percent under any load or speed condition.
 6. Minimum Short-Circuit Current (Withstand) Rating: 10 kA.
 7. Ambient Temperature Rating: Not less than 32 deg F and not exceeding 104 deg F.
 8. Humidity Rating: Less than 95 percent (noncondensing).
 9. Altitude Rating: Not exceeding 3300 feet.
 10. Vibration Withstand: Comply with NEMA ICS 61800-2.
 11. Overload Capability: 1.1 times the base load current for 60 seconds; minimum of 1.8 times the base load current for three seconds.
 12. Starting Torque: Minimum 100 percent of rated torque from 3 to 60 Hz.
 13. Speed Regulation: Plus or minus 5 percent.
 14. Output Carrier Frequency: Selectable; 0.5 to 15 kHz.
 15. Stop Modes: Programmable; includes fast, free-wheel, and dc injection braking.
- G. Inverter Logic: Microprocessor based, 16 bit, isolated from all power circuits.
- H. Isolated Control Interface: Allows VFCs to follow remote-control signal over a minimum 40:1 speed range.
1. Signal: Electrical.
- I. Internal Adjustability Capabilities:
1. Minimum Speed: 5 to 25 percent of maximum rpm.
 2. Maximum Speed: 80 to 100 percent of maximum rpm.
 3. Acceleration: 0.1 to 999.9 seconds.
 4. Deceleration: 0.1 to 999.9 seconds.
 5. Current Limit: 30 to minimum of 150 percent of maximum rating.
- J. Self-Protection and Reliability Features:
1. Surge Suppression: Factory installed as an integral part of the VFC, complying with UL 1449 SPD, Type 1 or Type 2.
 2. Surge Suppression: Field-mounted surge suppressors complying with Section 264313 "Surge Protection for Low-Voltage Electrical Power Circuits," UL 1449 SPD, Type 2.
 3. Loss of Input Signal Protection: Selectable response strategy, including speed default to a percent of the most recent speed, a preset speed, or stop; with alarm.
 4. Under- and overvoltage trips.
 5. Inverter overcurrent trips.
 6. VFC and Motor-Overload/Overtemperature Protection: Microprocessor-based thermal protection system for monitoring VFCs and motor thermal characteristics, and for providing VFC overtemperature and motor-overload alarm and trip; settings selectable via the keypad.
 7. Critical frequency rejection, with [three] <Insert number> selectable, adjustable deadbands.
 8. Instantaneous line-to-line and line-to-ground overcurrent trips.
 9. Loss-of-phase protection.
 10. Reverse-phase protection.
 11. Short-circuit protection.
 12. Motor-overtemperature fault.
- K. Automatic Reset/Restart: Attempt three restarts after drive fault or on return of power after an interruption and before shutting down for manual reset or fault correction; adjustable delay time between restart attempts.
- L. Power-Interruption Protection: To prevent motor from re-energizing after a power interruption until motor has stopped, unless "Bidirectional Autospeed Search" feature is available and engaged.
- M. Bidirectional Autospeed Search: Capable of starting VFC into rotating loads spinning in either direction and returning motor to set speed in proper direction, without causing damage to drive, motor, or load.

- N. Torque Boost: Automatically varies starting and continuous torque to at least 1.5 times the minimum torque to ensure high-starting torque and increased torque at slow speeds.
- O. Motor Temperature Compensation at Slow Speeds: Adjustable current fall-back based on output frequency for temperature protection of self-cooled, fan-ventilated motors at slow speeds.
- P. Integral Input Disconnecting Means and OCPD: [UL 489, instantaneous-trip circuit breaker] [UL 489, molded-case switch, with power fuse block and current-limiting fuses] [UL 489, thermal-magnetic circuit breaker] [NEMA KS 1, nonfusible switch, with power fuse block and current-limiting fuses] [NEMA KS 1, fusible switch] with pad-lockable, door-mounted handle mechanism.
 - 1. Disconnect Rating: Not less than 115 percent of VFC input current rating.
 - 2. Disconnect Rating: Not less than 115 percent of NFPA 70 motor full-load current rating or VFC input current rating, whichever is larger.
 - 3. Auxiliary Contacts: NO or NC, arranged to activate before switch blades open.
 - 4. Auxiliary contacts "a" and "b" arranged to activate with circuit-breaker handle.
 - 5. [NC] [NO] alarm contact that operates only when circuit breaker has tripped.

2.3 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: VFCs shall withstand the effects of earthquake motions determined according to ASCE/SEI 7. The designated VFCs shall be tested and certified by an NRTL as meeting the ICC-ES AC 156 test procedure requirements.

2.4 CONTROLS AND INDICATION

- A. Status Lights: Door-mounted LED indicators displaying the following conditions:
 - 1. Power on.
 - 2. Run.
 - 3. Overvoltage.
 - 4. Line fault.
 - 5. Overcurrent.
 - 6. External fault.
- B. Panel-Mounted Operator Station: Manufacturer's standard front-accessible, sealed keypad and plain-English-language digital display; allows complete programming, program copying, operating, monitoring, and diagnostic capability.
 - 1. Keypad: In addition to required programming and control keys, include keys for HAND, OFF, and AUTO modes.
 - 2. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: View only; view and operate; and view, operate, and service.
 - a. Control Authority: Supports at least four conditions: Off, local manual control at VFC, local automatic control at VFC, and automatic control through a remote source.
- C. Historical Logging Information and Displays:
 - 1. Real-time clock with current time and date.
 - 2. Running log of total power versus time.
 - 3. Total run time.
 - 4. Fault log, maintaining last four faults with time and date stamp for each.
- D. Indicating Devices: Digital display and additional readout devices as required, mounted flush in VFC door and connected to display VFC parameters including, but not limited to:
 - 1. Output frequency (Hz).
 - 2. Motor speed (rpm).
 - 3. Motor status (running, stop, fault).

4. Motor current (amperes).
5. Motor torque (percent).
6. Fault or alarming status (code).
7. PID feedback signal (percent).
8. DC-link voltage (V dc).
9. Set point frequency (Hz).
10. Motor output voltage (V ac).

E. Control Signal Interfaces:

1. Electric Input Signal Interface:
 - a. A minimum of two programmable analog inputs: 0- to 10-V dc
 - b. A minimum of six multifunction programmable digital inputs.
2. Remote Signal Inputs: Capability to accept any of the following speed-setting input signals from the DDC system for HVAC or other control systems:
 - a. 0- to 10-V dc.
 - b. 4- to 20-mA dc.
 - c. Potentiometer using up/down digital inputs.
 - d. Fixed frequencies using digital inputs.
3. Output Signal Interface: A minimum of one programmable analog output signal(s) 0- to 10-V dc, which can be configured for any of the following:
 - a. Output frequency (Hz).
 - b. Output current (load).
 - c. DC-link voltage (V dc).
 - d. Motor torque (percent).
 - e. Motor speed (rpm).
 - f. Set point frequency (Hz).
4. Remote Indication Interface: A minimum of two programmable dry-circuit relay outputs (120-V ac, 1 A) for remote indication of the following:
 - a. Motor running.
 - b. Set point speed reached.
 - c. Fault and warning indication (overtemperature or overcurrent).
 - d. PID high- or low-speed limits reached.

F. Interface with DDC System for HVAC: Factory-installed hardware and software shall interface with DDC system for HVAC to monitor, control, display, and record data for use in processing reports. VFC settings shall be retained within VFC's nonvolatile memory.

1. Hardwired Points:
 - a. Monitoring: On-off status.
 - b. Control: On-off operation.
2. Communication Interface: Comply with ASHRAE 135. Communication shall interface with DDC system for HVAC to remotely control and monitor lighting from a DDC system for HVAC operator workstation. Control features and monitoring points displayed locally at lighting panel shall be available through the DDC system for HVAC.

2.5 LINE CONDITIONING AND FILTERING

- A. Output Filtering:.
- B. EMI/RFI Filtering: CE marked; certify compliance with IEC 61800-3 for Category C2.
- C. EMI/RFI Filtering:.

2.6 ENCLOSURES

- A. VFC Enclosures: NEMA 250, to comply with environmental conditions at installed location.
 - 1. Outdoor Locations: Type 3R.

2.7 ACCESSORIES

- A. Breather and drain assemblies, to maintain interior pressure and release condensation in NEMA 250, Type 4 enclosures installed outdoors or in unconditioned interior spaces subject to humidity and temperature swings.
- B. Sun shields installed on fronts, sides, and tops of enclosures installed outdoors and subject to direct and extended sun exposure.
- C. Spare control-wiring terminal blocks[; unwired]; wired].

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Wall-Mounting Controllers: Install with tops at uniform height and with disconnect operating handles not higher than 79 inches above finished floor, unless otherwise indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall. For controllers not on walls, provide freestanding racks complying with Section 260529 "Hangers and Supports for Electrical Systems."
- B. Roof-Mounting Controllers: Install VFC on roofs with tops at uniform height and with disconnect operating handles not higher than 79 inches above finished roof surface unless otherwise indicated, and by bolting units to curbs or mounting on freestanding, lightweight, structural-steel channels bolted to curbs. Seal roof penetrations after raceways are installed.
 - 1. Curbs and roof penetrations are specified in Section 077200 "Roof Accessories."
 - 2. Structural-steel channels are specified in Section 260529 "Hangers and Supports for Electrical Systems."
- C. Seismic Bracing: Comply with requirements specified in Section 260548.16 "Seismic Controls for Electrical Systems."
- D. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- E. Install fuses in each fusible-switch VFC.
- F. Install fuses in control circuits if not factory installed. Comply with requirements in Section 262813 "Fuses."
- G. Install heaters in thermal-overload relays. Select heaters based on actual nameplate full-load amperes after motors are installed.
- H. Install, connect, and fuse thermal-protector monitoring relays furnished with motor-driven equipment.
- I. Comply with NECA 1.

3.2 CONTROL WIRING INSTALLATION

- A. Install wiring between VFCs and remote devices **and facility's central-control system**. Comply with requirements in Section 260523 "Control-Voltage Electrical Power Cables."

- B. Bundle, train, and support wiring in enclosures.
- C. Connect selector switches and other automatic-control devices where applicable.
 - 1. Connect selector switches to bypass only those manual- and automatic-control devices that have no safety functions when switches are in manual-control position.
 - 2. Connect selector switches with control circuit in both manual and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor-overload protectors.

3.3 IDENTIFICATION

- A. Identify VFCs, components, and control wiring. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
 - 1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
 - 2. Label each VFC with engraved nameplate.
 - 3. Label each enclosure-mounted control and pilot device.

3.4 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections.
- C. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each VFC element, bus, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.
- D. Tests and Inspections:
 - 1. Inspect VFC, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment.
 - 2. Test insulation resistance for each VFC element, component, connecting motor supply, feeder, and control circuits.
 - 3. Test continuity of each circuit.
 - 4. Verify that voltages at VFC locations are within 10 percent of motor nameplate rated voltages. If outside this range for any motor, notify Owner before starting the motor(s).
 - 5. Test each motor for proper phase rotation.
 - 6. Perform tests according to the Inspection and Test Procedures for Adjustable Speed Drives stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 - 7. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 - 8. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- E. Prepare test and inspection reports, including a certified report that identifies the VFC and describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations made after remedial action.

3.5 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.

3.6 ADJUSTING

- A. Program microprocessors for required operational sequences, status indications, alarms, event recording, and display features. Clear events memory after final acceptance testing and prior to Substantial Completion.
- B. Set the taps on reduced-voltage autotransformer controllers.
- C. Set field-adjustable circuit-breaker trip ranges **as specified in Section 260573.16 "Coordination Studies."**
- D. Set field-adjustable pressure switches.

3.7 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, reprogram, and maintain VFCs.

END OF SECTION 262923

SECTION 263213 - ENGINE GENERATORS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes packaged engine-generator sets for **emergency andstandby** power supply with the features as specified and indicated.
- B. Related Sections include the following:
 - 1. Division 26 Section "Transfer Switches" for transfer switches including sensors and relays to initiate automatic-starting and -stopping signals for engine-generator sets.

1.2 DEFINITIONS

- A. Operational Bandwidth: The total variation from the lowest to highest value of a parameter over the range of conditions indicated, expressed as a percentage of the nominal value of the parameter.

1.3 SUBMITTALS

- A. Product Data: For each type of packaged engine generator indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. In addition, include the following:
 - 1. Thermal damage curve for generator.
 - 2. Time-current characteristic curves for generator protective device.
- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 1. Dimensioned outline plan and elevation drawings of engine-generator set and other components specified.
 - 2. Design Calculations: Signed and sealed by a qualified professional engineer. Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
 - 3. Vibration Isolation Base Details: Signed and sealed by a qualified professional engineer. Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include base weights.
 - 4. Wiring Diagrams: Power, signal, and control wiring.
- C. Compliance Statement
 - 1. Submit a document which states whether the proposed product(s) either comply or deviate from the Specification requirements. This includes all Part 1, Part 2, and Part 3 specification items. Specification requirements not noted as deviations will be assumed as complying.
 - 2. Provide the statement in an itemized, columnar format as follows:
 - a. Column 1 - Reference to the specification item, organized in the same sequential order as in the Specification.
 - b. Column 2 - Explanation for noted deviations.
- D. Manufacturer Seismic Qualification Certification: Submit certification that **day tank**, engine-generator set, batteries, battery racks, accessories, and components will withstand seismic forces defined in Division 26 Section "Vibration and Seismic Controls for Electrical Systems." Include the following:
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

- b. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- E. Qualification Data: For .
- F. Operation and Maintenance Data: For packaged engine generators to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:
- 1. List of tools and replacement items recommended to be stored at Project for ready access. Include part and drawing numbers, current unit prices, and source of supply.

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
- 1. Maintenance Proximity: Not more than 200 miles (321 km) from Installer's place of business to Project site.
 - 2. Engineering Responsibility: Preparation of data for vibration isolators and seismic restraints of engine skid mounts, including Shop Drawings, based on testing and engineering analysis of manufacturer's standard units in assemblies similar to those indicated for this Project.
- B. Manufacturer Qualifications: A qualified manufacturer. Maintain, within 200 miles (321 km) of Project site, a service center capable of providing training, parts, and emergency maintenance repairs.
- C. Source Limitations: Obtain packaged generator sets and auxiliary components through one source from a single manufacturer.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- E. Comply with ASME B15.1.
- F. Comply with NFPA 37.
- G. Comply with NFPA 70.
- H. Comply with NFPA 99.
- I. Comply with NFPA 110 requirements for Level 1 2 emergency power supply system.
- J. Comply with UL 2200.
- K. Engine Exhaust Emissions: Comply with applicable state and local government requirements.
- L. Noise Emission: Comply with applicable state and local government requirements for maximum noise level at adjacent property boundaries due to sound emitted by generator set including engine, engine exhaust, engine cooling-air intake and discharge, and other components of installation.

1.5 PROJECT CONDITIONS

- A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service according to requirements indicated:
 - 1. Notify Architect Construction Manager Owner no fewer than two days in advance of proposed interruption of electrical service.
 - 2. Do not proceed with interruption of electrical service without Owner's written permission.

- B. Environmental Conditions: Engine-generator system shall withstand the following environmental conditions without mechanical or electrical damage or degradation of performance capability:
 - 1. Ambient Temperature: 5 to 40 deg C.
 - 2. Relative Humidity: 0 to 95 percent.
 - 3. Altitude: Sea level to 1000 feet (300 m).

- C. Unusual Service Conditions: Engine-generator equipment and installation are required to operate under the following conditions:
 - 1. .

1.6 COORDINATION

- A. Coordinate size and location of concrete bases for package engine generators and remote radiators mounted on grade. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

- B. Coordinate size and location of roof curbs, equipment supports, and roof penetrations for remote radiators. These items are specified in Division 07 Section "Roof Accessories."

1.7 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of packaged engine generators and associated auxiliary components that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: 5 years from date of Substantial Completion.

1.8 MAINTENANCE SERVICE

- A. Initial Maintenance Service: Beginning at Date of Acceptance, provide 12 months' full maintenance by skilled employees of manufacturer's designated service organization. Include quarterly exercising to check for proper starting, load transfer, and running under load. Include routine preventive maintenance as recommended by manufacturer and adjusting as required for proper operation. Provide parts and supplies same as those used in the manufacture and installation of original equipment.

1.9 EXTRA MATERIALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Fuses: One for every 10 of each type and rating, but no fewer than one of each.
 - 2. Indicator Lamps: Two for every six of each type used, but no fewer than two of each.
 - 3. Filters: One set each of lubricating oil, fuel, and combustion-air filters.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Caterpillar; Engine Div.
 2. Generac Power Systems, Inc.
 3. Kohler Energy
 4. Onan/Cummins Power Generation; Industrial Business Group.
 5. MTU Onsite Energy Corporation.

2.2 ENGINE-GENERATOR SET

- A. Factory-assembled and -tested, engine-generator set.
- B. Mounting Frame: Maintain alignment of mounted components without depending on concrete foundation; and have lifting attachments.
1. Rigging Diagram: Inscribed on metal plate permanently attached to mounting frame to indicate location and lifting capacity of each lifting attachment and generator-set center of gravity.
- C. Capacities and Characteristics:
1. Power Output Ratings: Continuous electrical output power rating for standby operation of not less than 500kW, at 80 percent lagging power factor, 480/277 -volt, three phase, 4-wire, 60 hertz. In addition, provide power required for generator accessories including battery charger and radiator.
 2. Provide generator with a minimum motor starting capability of 300SkVA and capable of sustaining a minimum of 90 percent of rated no-load voltage with the specified kVA load at near zero power factor applied to the generator.
 3. Nameplates: For each major system component to identify manufacturer's name and address, and model and serial number of component.
- D. Generator-Set Performance:
1. Steady-State Voltage Operational Bandwidth: 3 percent of rated output voltage from no load to full load.
 2. Transient Voltage Performance: Not more than 20 percent variation for 50 percent step-load increase or decrease. Voltage shall recover and remain within the steady-state operating band within three seconds.
 3. Steady-State Frequency Operational Bandwidth: 0.5 percent of rated frequency from no load to full load.
 4. Steady-State Frequency Stability: When system is operating at any constant load within the rated load, there shall be no random speed variations outside the steady-state operational band and no hunting or surging of speed.
 5. Transient Frequency Performance: Less than 5 percent variation for 50 percent step-load increase or decrease. Frequency shall recover and remain within the steady-state operating band within five seconds.
 6. Output Waveform: At no load, harmonic content measured line to line or line to neutral shall not exceed 5 percent total and 3 percent for single harmonics. Telephone influence factor, determined according to NEMA MG 1, shall not exceed 50 percent.
 7. Sustained Short-Circuit Current: For a 3-phase, bolted short circuit at system output terminals, system shall supply a minimum of 250 percent of rated full-load current for not less than 10 seconds and then clear the fault automatically, without damage to generator system components.
 8. Start Time: Comply with NFPA 110, Type 10, system requirements.
- E. Generator-Set Performance for Sensitive Loads:

1. Oversizing generator compared with the rated power output of the engine is permissible to meet specified performance.
 - a. Nameplate Data for Oversized Generator: Show ratings required by the Contract Documents rather than ratings that would normally be applied to generator size installed.
2. Steady-State Voltage Operational Bandwidth: 1 percent of rated output voltage from no load to full load.
3. Transient Voltage Performance: Not more than 10 percent variation for 50 percent step-load increase or decrease. Voltage shall recover and remain within the steady-state operating band within 0.5 second.
4. Steady-State Frequency Operational Bandwidth: Plus or minus 0.25 percent of rated frequency from no load to full load.
5. Steady-State Frequency Stability: When system is operating at any constant load within the rated load, there shall be no random speed variations outside the steady-state operational band and no hunting or surging of speed.
6. Transient Frequency Performance: Less than 2-Hz variation for 50 percent step-load increase or decrease. Frequency shall recover and remain within the steady-state operating band within three seconds.
7. Output Waveform: At no load, harmonic content measured line to neutral shall not exceed 2 percent total with no slot ripple. Telephone influence factor, determined according to NEMA MG 1, shall not exceed 50 percent.
8. Sustained Short-Circuit Current: For a 3-phase, bolted short circuit at system output terminals, system shall supply a minimum of 300 percent of rated full-load current for not less than 10 seconds and then clear the fault automatically, without damage to winding insulation or other generator system components.
9. Excitation System: Performance shall be unaffected by voltage distortion caused by nonlinear load.
 - a. Provide permanent magnet excitation for power source to voltage regulator.
10. Start Time: Comply with NFPA 110, Type 10, system requirements.

2.3 ENGINE

- A. Fuel: Fuel oil, Grade DF-2 Natural gas with automatic LP-gas standby Natural gas.
- B. Rated Engine Speed: 1800 rpm.
- C. Maximum Piston Speed for Four-Cycle Engines: 2250 fpm.
- D. Lubrication System: The following items are mounted on engine or skid:
 1. Filter and Strainer: Rated to remove 90 percent of particles 5 micrometers and smaller while passing full flow.
 2. Thermostatic Control Valve: Control flow in system to maintain optimum oil temperature. Unit shall be capable of full flow and is designed to be fail-safe.
 3. Crankcase Drain: Arranged for complete gravity drainage to an easily removable container with no disassembly and without use of pumps, siphons, special tools, or appliances.
- E. Engine Fuel System:
 1. Main Fuel Pump: Mounted on engine. Pump ensures adequate primary fuel flow under starting and load conditions.
 2. Relief-Bypass Valve: Automatically regulates pressure in fuel line and returns excess fuel to source.
- F. Coolant Jacket Heater: Electric-immersion type, factory installed in coolant jacket system. Comply with NFPA 110 requirements for Level 1 equipment for heater capacity.

Generator Size

Heater Voltage

0-400 kW	120 or 208 single phase
400-800 kW	208 or 480 single phase
Above 800 kW	480 single phase

1. Suitable for operation on **120**-volt, single phase, 60 hertz power.
- G. Governor: Adjustable isochronous, with speed sensing.
- H. Cooling System: Closed loop, liquid cooled, with radiator factory mounted on engine-generator-set mounting frame and integral engine-driven coolant pump.
1. Coolant: Solution of 50 percent ethylene-glycol-based antifreeze and 50 percent water, with anticorrosion additives as recommended by engine manufacturer.
 2. Size of Radiator: Adequate to contain expansion of total system coolant from cold start to 110 percent load condition.
 3. Expansion Tank: Constructed of welded steel plate and rated to withstand maximum closed-loop coolant system pressure for engine used. Equip with gage glass and petcock.
 4. Temperature Control: Self-contained, thermostatic-control valve modulates coolant flow automatically to maintain optimum constant coolant temperature as recommended by engine manufacturer.
 5. Coolant Hose: Flexible assembly with inside surface of nonporous rubber and outer covering of aging-, ultraviolet-, and abrasion-resistant fabric.
 - a. Rating: 50-psig maximum working pressure with coolant at 180 deg F, and noncollapsible under vacuum.
 - b. End Fittings: Flanges or steel pipe nipples with clamps to suit piping and equipment connections.
- I. Cooling System: Closed loop, liquid cooled, with remote radiator and integral engine-driven coolant pump.
1. Configuration: **Vertical** air discharge.
 2. Size of Radiator: Adequate to contain expansion of total system coolant from cold start to 110 percent load condition.
 3. Expansion Tank: Constructed of welded steel plate and rated to withstand maximum closed-loop coolant system pressure for engine used. Equip with gage glass and petcock.
 4. Fan: Driven by **multiple belts from engine shaft**Coolant: Solution of 50 percent ethylene-glycol-based antifreeze and 50 percent water, with anticorrosion additives as recommended by engine manufacturer.
 5. Temperature Control: Self-contained, thermostatic-control valve modulates coolant flow automatically to maintain optimum constant coolant temperature as recommended by engine manufacturer.
- J. Muffler/Silencer: Industrial type, sized as recommended by engine manufacturer and selected with exhaust piping system to not exceed engine manufacturer's engine backpressure requirements.
1. Minimum sound attenuation of 12 dB at 500 Hz.
 2. Sound level measured at a distance of 25 feet from exhaust discharge after installation is complete shall be 70 dBA or less.
- K. Air-Intake Filter: **Standard**, engine-mounted air cleaner with replaceable dry-filter element and "blocked filter" indicator.
- L. Starting System: 1 **2**-V electric, with negative ground.
1. Components: Sized so they will not be damaged during a full engine-cranking cycle with ambient temperature at maximum specified in Part 1 "Project Conditions" Article.
 2. Cranking Motor: Heavy-duty unit that automatically engages and releases from engine flywheel without binding.
 3. Cranking Cycle: As required by NFPA 110 for system level specified.

4. Battery: Lead-acid adequate capacity within ambient temperature range specified in Part 1 "Project Conditions" Article to provide specified cranking cycle at least **twice** without recharging.
5. Battery Cable: Size as recommended by engine manufacturer for cable length as required. Include required interconnecting conductors and connection accessories.
6. Battery Compartment: Factory fabricated of metal with acid-resistant finish and thermal insulation. Thermostatically controlled heater shall be arranged to maintain battery above 10 deg C regardless of external ambient temperature within range specified in Part 1 "Project Conditions" Article. Include accessories required to support and fasten batteries in place.
7. Battery-Charging Alternator: Factory mounted on engine with solid-state voltage regulation and 35-A minimum continuous rating.
8. Battery Charger: Current-limiting, automatic-equalizing and float-charging type. Unit shall comply with UL 1236 and include the following features:
 - a. Operation: Equalizing-charging rate of 10 A shall be initiated automatically after battery has lost charge until an adjustable equalizing voltage is achieved at battery terminals. Unit shall then be automatically switched to a lower float-charging mode and shall continue to operate in that mode until battery is discharged again.
 - b. Automatic Temperature Compensation: Adjust float and equalize voltages for variations in ambient temperature from minus 40 deg C to plus 60 deg C to prevent overcharging at high temperatures and undercharging at low temperatures.
 - c. Automatic Voltage Regulation: Maintain constant output voltage regardless of input voltage variations up to plus or minus 10 percent.
 - d. Ammeter and Voltmeter: Flush mounted in door. Meters shall indicate charging rates.
 - e. Safety Functions: Sense abnormally low battery voltage and close contacts providing low battery voltage indication on control and monitoring panel. Sense high battery voltage and loss of ac input or dc output of battery charger. Either condition shall close contacts that provide a battery-charger malfunction indication at system control and monitoring panel.
 - f. Enclosure and Mounting: NEMA 250, Type 1, wall-mounted cabinet.

2.4 FUEL OIL STORAGE

- A. Comply with NFPA 30.
- B. Day Tank: Comply with UL 142, freestanding, factory-fabricated fuel tank assembly, with integral, float-controlled transfer pump and the following features:
 1. Containment: Integral rupture basin with a capacity of 150 percent of nominal capacity of day tank.
 - a. Leak Detector: Locate in rupture basin and connect to provide audible and visual alarm in the event of day-tank leak.
 2. Tank Capacity: As recommended by engine manufacturer for an uninterrupted period of 4 hours' operation at 100 percent of rated power output of engine-generator system without being refilled.
 3. Pump Capacity: Exceeds maximum flow of fuel drawn by engine-mounted fuel supply pump at 110 percent of rated capacity, including fuel returned from engine.
 4. Low-Level Alarm Sensor: Liquid-level device operates alarm contacts at 25 percent of normal fuel level.
 5. High-Level Alarm Sensor: Liquid-level device operates alarm and redundant fuel shutoff contacts at midpoint between overflow level and 100 percent of normal fuel level.
 6. Piping Connections: Factory-installed fuel supply and return lines from tank to engine; local fuel fill, vent line, overflow line; and tank drain line with shutoff valve.
 7. Redundant High-Level Fuel Shutoff: Actuated by high-level alarm sensor in day tank to operate a separate motor device that disconnects day-tank pump motor. Sensor shall signal solenoid valve, located in fuel suction line between fuel storage tank and day tank, to close. Both actions shall remain in shutoff state until manually reset. Shutoff action shall initiate an alarm signal to control panel but shall not shut down engine-generator set.
- C. Base-Mounted Fuel Oil Tank: Factory installed and piped, complying with UL 142 fuel oil tank. Features include the following:
 1. Tank level indicator.
 2. Capacity: Fuel for 24 hours' continuous operation at 100 percent rated power output.

3. Vandal-resistant fill cap.
 4. Containment Provisions: Comply with requirements of authorities having jurisdiction.
- D. Fuel Oil Tank Alarm Panel: Weatherproof enclosure with the following features:
1. Low level alarm.
 2. High level alarm.
 3. Critical high level alarm.
 4. Fuel tank leak alarm.
 5. Alarm horn.
 6. Silence button.
- E. Fuel Oil
1. Fill storage tanks with fuel oil prior to Acceptance Testing and replenish spent fuel after Owner Acceptance.

2.5 CONTROL AND MONITORING

- A. Automatic Starting System Sequence of Operation: When mode-selector switch on the control and monitoring panel is in the automatic position, remote-control contacts in one or more separate automatic transfer switches initiate starting and stopping of generator set. When mode-selector switch is switched to the on position, generator set starts. The off position of same switch initiates generator-set shutdown. When generator set is running, specified system or equipment failures or derangements automatically shut down generator set and initiate alarms. Operation of a remote emergency-stop switch also shuts down generator set.
1. Engine start circuits from emergency and fire pump transfer switches shall be monitored for broken, shorted , or disconnected wires as required by NFPA 70 articles 695 and 700. Loss of start circuit wiring shall start the generator. Provide all control wiring and hardware required to provide engine start circuit integrity monitoring as required by the referenced code articles.
- B. Configuration: Operating and safety indications, protective devices, basic system controls, and engine gages shall be grouped in a common control and monitoring panel mounted on the generator set. Mounting method shall isolate the control panel from generator-set vibration.
- C. Indicating and Protective Devices and Controls: As required by NFPA 110 for Level 1 2 system, and the following:
1. AC voltmeter.
 2. AC ammeter.
 3. AC frequency meter.
 4. DC voltmeter (alternator battery charging).
 5. Engine-coolant temperature gage.
 6. Engine lubricating-oil pressure gage.
 7. Running-time meter.
 8. Ammeter-voltmeter, phase-selector switch(es).
 9. Generator-voltage adjusting rheostat.
 10. Fuel tank derangement alarm.
 11. Fuel tank high-level shutdown of fuel supply alarm.
 12. Generator overload.
- D. Indicating and Protective Devices and Controls:
1. AC voltmeter.
 2. AC ammeter.
 3. AC frequency meter.
 4. DC voltmeter (alternator battery charging).
 5. Engine-coolant temperature gage.
 6. Engine lubricating-oil pressure gage.
 7. Running-time meter.

8. Ammeter-voltmeter, phase-selector switch(es).
 9. Generator-voltage adjusting rheostat.
 10. Start-stop switch.
 11. Overspeed shutdown device.
 12. Coolant high-temperature shutdown device.
 13. Coolant low-level shutdown device.
 14. Oil low-pressure shutdown device.
 15. Fuel tank derangement alarm.
 16. Fuel tank high-level shutdown of fuel supply alarm.
 17. Generator overload.
- E. Supporting Items: Include sensors, transducers, terminals, relays, and other devices and include wiring required to support specified items. Locate sensors and other supporting items on engine or generator, unless otherwise indicated.
- F. Connection to Data Link: A separate terminal block, factory wired to Form C dry contacts, for each alarm and status indication is reserved for connections for data-link transmission of indications to remote data terminals. Data system connections to terminals are covered in Division 26 Section "Electrical Power Monitoring and Control."
- G. Common Remote Audible Alarm: Comply with NFPA 110 requirements for Level 1 systems. Include necessary contacts and terminals in control and monitoring panel.
1. Overcrank shutdown.
 2. Coolant low-temperature alarm.
 3. Control switch not in auto position.
 4. Battery-charger malfunction alarm.
 5. Battery low-voltage alarm.
- H. Common Remote Audible Alarm: Signal the occurrence of any events listed below without differentiating between event types. Connect so that after an alarm is silenced, clearing of initiating condition will reactivate alarm until silencing switch is reset.
1. Engine high-temperature shutdown.
 2. Lube-oil, low-pressure shutdown.
 3. Overspeed shutdown.
 4. Remote emergency-stop shutdown.
 5. Engine high-temperature prealarm.
 6. Lube-oil, low-pressure prealarm.
 7. Fuel tank, low-fuel level.
 8. Low coolant level.
- I. Remote Alarm Annunciator: Comply with NFPA 99. An LED labeled with proper alarm conditions shall identify each alarm event and a common audible signal shall sound for each alarm condition. Silencing switch in face of panel shall silence signal without altering visual indication. Connect so that after an alarm is silenced, clearing of initiating condition will reactivate alarm until silencing switch is reset. Cabinet and faceplate are surface- or flush-mounting type to suit mounting conditions indicated.
- J. Remote Emergency-Stop Switch: Flush; wall mounted, unless otherwise indicated; and labeled. Push button shall be protected from accidental operation.

2.6 GENERATOR OVERCURRENT AND FAULT PROTECTION

- A. Generator Circuit Breaker: Molded-case, thermal-magnetic type; 100 percent rated; complying with NEMA AB 1 and UL 489.
1. Tripping Characteristic: Designed specifically for generator protection.
 2. Trip Rating: Matched to generator rating.
 3. Shunt Trip: Connected to trip breaker when generator set is shut down by other protective devices.

4. Mounting: Adjacent to or integrated with control and monitoring panel.
 5. Main circuit breaker UL-listed as service-entrance equipment.
- B. Generator Protector: Microprocessor-based unit shall continuously monitor current level in each phase of generator output, integrate generator heating effect over time, and predict when thermal damage of alternator will occur. When signaled by generator protector or other generator-set protective devices, a shunt-trip device in the generator disconnect switch shall open the switch to disconnect the generator from load circuits. Protector shall perform the following functions:
1. Initiates a generator overload alarm when generator has operated at an overload equivalent to 110 percent of full-rated load for 60 seconds. Indication for this alarm is integrated with other generator-set malfunction alarms.
 2. Under single or three-phase fault conditions, regulates generator to 300 percent of rated full-load current for up to 10 seconds.
 3. As overcurrent heating effect on the generator approaches the thermal damage point of the unit, protector switches the excitation system off, opens the generator disconnect device, and shuts down the generator set.
 4. Senses clearing of a fault by other overcurrent devices and controls recovery of rated voltage to avoid overshoot.
- C. Ground-Fault Indication: Comply with NFPA 70, "Emergency System" signals for ground-fault. Integrate ground-fault alarm indication with other generator-set alarm indications.

2.7 GENERATOR, EXCITER, AND VOLTAGE REGULATOR

- A. Comply with NEMA MG 1.
- B. Drive: Generator shaft shall be directly connected to engine shaft. Exciter shall be rotated integrally with generator rotor.
- C. Electrical Insulation: Class H or Class F.
- D. Stator-Winding Leads: Brought out to terminal box to permit future reconnection for other voltages if required.
- E. Construction shall prevent mechanical, electrical, and thermal damage due to vibration, overspeed up to 125 percent of rating, and heat during operation at 110 percent of rated capacity.
- F. Enclosure: Dripproof.
- G. Instrument Transformers: Mounted within generator enclosure.
- H. Voltage Regulator: Solid-state type, separate from exciter, providing performance as specified.
1. Adjusting rheostat on control and monitoring panel shall provide plus or minus 5 percent adjustment of output-voltage operating band.
- I. Strip Heater: Thermostatically controlled unit arranged to maintain stator windings above dew point.
- J. Windings: Two-thirds pitch stator winding and fully linked amortisseur winding.
- K. Subtransient Reactance: 12 percent, maximum.

2.8 OUTDOOR GENERATOR-SET ENCLOSURE

- A. Description: Vandal-resistant, weatherproof steel housing, wind resistant up to 100 mph. Multiple panels shall be lockable and provide adequate access to components requiring maintenance. Panels shall be removable by one person without tools. Instruments, control, day tank and battery system shall be mounted within enclosure.
1. Provide enclosure which maintains a minimum interior ambient temperature of 40 degrees F. per NFPA 110.
- B. Description: Prefabricated or preengineered walk-in enclosure with the following features:
1. Provide enclosure which maintains a minimum interior ambient temperature of 40 degrees F per NFPA 110.
 2. Construction: Galvanized-steel, metal-clad, integral structural-steel-framed building erected on concrete foundation.
 3. Structural Design and Anchorage: Comply with ASCE 7 for wind loads.
 4. Space Heater: Thermostatically controlled and sized to prevent condensation.
 5. Louvers: Equipped with bird screen and filter arranged to permit air circulation when engine is not running while excluding exterior dust, birds, and rodents.
 6. Hinged Doors: With padlocking provisions.
 7. Ventilation: Louvers equipped with bird screen and filter arranged to permit air circulation while excluding exterior dust, birds, and rodents.
 8. Thermal Insulation: Manufacturer's standard materials and thickness selected in coordination with space heater to maintain winter interior temperature within operating limits required by engine-generator-set components and NFPA 110.
 9. Muffler Location: Within enclosure.
 10. Access Stairs and Platforms: Provide where indicated on Drawings or if required by governing codes to provide access to overcurrent protective devices.
- C. Engine Cooling Airflow through Enclosure: Maintain temperature rise of system components within required limits when unit operates at 110 percent of rated load for 2 hours with ambient temperature at top of range specified in system service conditions.
1. Louvers: Fixed-engine, cooling-air inlet and discharge. Storm-proof and drainable louvers prevent entry of rain and snow.
 2. Automatic Dampers: At engine cooling-air inlet and discharge. Dampers shall be closed to reduce enclosure heat loss in cold weather when unit is not operating.
- D. Interior Lights with Switch: Factory-wired, vaporproof-type fixtures within housing; arranged to illuminate controls and accessible interior. Arrange for external electrical connection.
1. AC lighting system and connection point for operation when remote source is available.
 2. DC lighting system for operation when remote source and generator are both unavailable.
- E. Convenience Outlets: Factory wired , **GFCI**. Arrange for external electrical connection.
- F. Load Center: Provide a 208Y/120V, 3 Phase, 4 Wire, 100A MCB (main circuit breaker) type panelboard within the enclosure for power service to generator accessories including but not limited to: battery charger, jacket water heaters, lights, receptacles, enclosure heater, and motorized dampers. Generator accessories shall be factory wired to the panelboard. All internal wiring shall be type THHN/THWN-2 in EMT in accordance with all governing codes. If load center is located near the air intake louver and will be subject to moisture from rain or snow, provide a NEMA 3R enclosure.

2.9 LOAD BANK CONNECTION BOX

- A. Weather-resistant enclosure, permanently wired to the generator to permit the connection of a portable load bank. The load bank connection box shall have the following features:

1. Housing: Aluminum, NEMA 3R
2. Rating: 800A
3. Permanent Bus Connection: Mechanical Lugs
4. Load bank connection: Female Cam style receptacles, color coded for the voltage system.
5. Accessories: Phase Rotation Monitor

2.10 MOTORS

- A. General requirements for motors are specified in Division 23 Section "Common Motor Requirements for HVAC Equipment."
1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 2. Controllers, Electrical Devices, and Wiring: Electrical devices and connections are specified in Division 26 Sections.

2.11 VIBRATION ISOLATION DEVICES

- A. Elastomeric Isolator Pads: Oil- and water-resistant elastomer or natural rubber, arranged in single or multiple layers, molded with a nonslip pattern and galvanized-steel baseplates of sufficient stiffness for uniform loading over pad area, and factory cut to sizes that match requirements of supported equipment.
1. Material: Bridge-bearing neoprene, complying with AASHTO M 251.
 2. Durometer Rating: 30.
 3. Number of Layers: Four Insert number.
- B. Restrained Spring Isolators: Freestanding, steel, open-spring isolators with seismic restraint.
1. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to wind loads or if weight is removed; factory-drilled baseplate bonded to 1/4-inch- thick, elastomeric isolator pad attached to baseplate underside; and adjustable equipment mounting and leveling bolt that acts as blocking during installation.
 2. Outside Spring Diameter: Not less than 80 percent of compressed height of the spring at rated load.
 3. Minimum Additional Travel: 50 percent of required deflection at rated load.
 4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
 5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

2.12 FINISHES

- A. Indoor and Outdoor Enclosures and Components: Manufacturer's standard finish over corrosion-resistant pretreatment and compatible primer. Outdoor enclosure finish color shall be selected by Architect.

2.13 SOURCE QUALITY CONTROL

- A. Prototype Testing: Factory test engine-generator set using same engine model, constructed of identical or equivalent components and equipped with identical or equivalent accessories.
1. Tests: Comply with NFPA 110, Level 1 Energy Converters and with IEEE 115.
- B. Project-Specific Equipment Tests: Before shipment, factory test engine-generator set and other system components and accessories manufactured specifically for this Project. Perform tests at rated load and power factor. Include the following tests:
1. Test components and accessories furnished with installed unit that are not identical to those on tested prototype to demonstrate compatibility and reliability.
 2. Full load run.
 3. Maximum power.
 4. Voltage regulation.

5. Transient and steady-state governing.
6. Single-step load pickup.
7. Safety shutdown.
8. Provide 14 days' advance notice of tests and opportunity for observation of tests by Owner's representative.
9. Report factory test results within 10 days of completion of test.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas, equipment bases, and conditions, with Installer present, for compliance with requirements for installation and other conditions affecting packaged engine-generator performance.
- B. Examine roughing-in of piping systems and electrical connections. Verify actual locations of connections before packaged engine-generator installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Comply with packaged engine-generator manufacturers' written installation and alignment instructions and with NFPA 110.
- B. Install packaged engine generator to provide access, without removing connections or accessories, for periodic maintenance.
- C. Install packaged engine generator with vibration isolation devices as specified having a minimum deflection of 1 inch. Insert static deflection on 4-inch- high concrete base. Secure sets to anchor bolts installed in concrete bases. Concrete base construction is specified in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."
- D. Install remote radiator with vibration isolation devices as specified having a minimum deflection of 1 inch (25 mm) on concrete base on grade.
- E. Install Schedule 40, black steel piping with welded joints for cooling water piping between engine-generator set and remote radiator. Piping materials and installation requirements are specified in Division 23 Section "Hydronic Piping."
- F. Install Schedule 40, black steel piping with welded joints and connect to engine muffler. Install thimble at wall. Piping shall be same diameter as muffler outlet. Flexible connectors and steel piping materials and installation requirements are specified in Division 23 Section "Hydronic Piping."
 1. Install condensate drain piping to muffler drain outlet full size of drain connection with a shutoff valve, stainless-steel flexible connector, and Schedule 40, black steel pipe with welded joints. Flexible connectors and piping materials and installation requirements are specified in Division 23 Section "Hydronic Piping."
- G. Electrical Wiring: Install electrical devices furnished by equipment manufacturers but not specified to be factory mounted.

3.3 CONNECTIONS

- A. Piping installation requirements are specified in Division 23 Sections. Drawings indicate general arrangement of piping and specialties.

- B. Connect fuel, cooling-system, and exhaust-system piping adjacent to packaged engine generator to allow service and maintenance.
- C. Connect cooling-system water piping to engine-generator set and remote radiator with flexible connectors.
- D. Connect engine exhaust pipe to engine with flexible connector.
- E. Connect fuel piping to engines with a gate valve and union and flexible connector.
 - 1. Diesel storage tanks, tank accessories, piping, valves, and specialties for fuel systems are specified in Division 23 Section "Facility Fuel-Oil Piping."
 - 2. Natural-gas piping, valves, and specialties for gas distribution are specified in Division 23 Section "Facility Natural-Gas Piping."
 - 3. LP-gas piping, valves, and specialties for gas piping are specified in Division 23 Section "Facility Liquefied-Petroleum Gas Piping."
- F. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."
- G. Connect power wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."
- H. Provide engine start wiring from generator controller to transfer switches. Engine start wiring shall be type and size as recommended by manufacturer. Where manufacturer does not have a specific recommendation, provide #12 AWG THHN/THWN-2 conductors.
 - 1. Route engine start wiring in separate raceways and entirely independent from all wiring
 - 2. Coordinate engine start signal wiring installation with transfer switch manufacturer and installer. For emergency and fire pump transfer switches, ensure proper connection and operation of the engine start circuit integrity monitoring required by NFPA 70 articles 695 and 700.
- I. Provide power and communications wiring for remote generator annunciator (derangement) panel. Provide wiring type and size as recommended by manufacturer.
 - 1. Where generator annunciator panel location is not specifically indicated on Drawings, coordinate exact location with Owner prior to installation.

3.4 IDENTIFICATION

- A. Identify system components according to Division 23 Section "Identification for HVAC Piping and Equipment" and Division 26 Section "Identification for Electrical Systems."

3.5 FIELD QUALITY CONTROL

- A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections and prepare test reports.
- B. Tests and Inspections:
 - 1. Perform tests recommended by manufacturer and each electrical test and visual and mechanical inspection (except those indicated to be optional) for "AC Generators and for Emergency Systems" specified in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 - 2. NFPA 110 Acceptance Tests: Perform tests required by NFPA 110 that are additional to those specified here including, but not limited to, single-step full-load pickup test.
 - 3. Battery Tests: Equalize charging of battery cells according to manufacturer's written instructions. Record individual cell voltages.
 - a. Measure charging voltage and voltages between available battery terminals for full-charging and float-charging conditions. Check electrolyte level and specific gravity under both conditions.

- b. Test for contact integrity of all connectors. Perform an integrity load test and a capacity load test for the battery.
 - c. Verify acceptance of charge for each element of the battery after discharge.
 - d. Verify that measurements are within manufacturer's specifications.
- 4. Battery-Charger Tests: Verify specified rates of charge for both equalizing and float-charging conditions.
 - 5. System Integrity Tests: Methodically verify proper installation, connection, and integrity of each element of engine-generator system before and during system operation. Check for air, exhaust, and fluid leaks.
 - 6. Exhaust-System Back-Pressure Test: Use a manometer with a scale exceeding 40-inch wg. Connect to exhaust line close to engine exhaust manifold. Verify that back pressure at full-rated load is within manufacturer's written allowable limits for the engine.
 - 7. Exhaust Emissions Test: Comply with applicable government test criteria.
 - 8. Voltage and Frequency Transient Stability Tests: Use recording oscilloscope to measure voltage and frequency transients for 50 and 100 percent step-load increases and decreases, and verify that performance is as specified.
 - 9. Harmonic-Content Tests: Measure harmonic content of output voltage under 25 percent and at 100 percent of rated linear load. Verify that harmonic content is within specified limits.
 - 10. Noise Level Tests: Measure A-weighted level of noise emanating from generator-set installation, including engine exhaust and cooling-air intake and discharge, at four locations on the property line, and compare measured levels with required values.
- C. Coordinate tests with tests for transfer switches and run them concurrently.
 - D. Test instruments shall have been calibrated within the last 12 months, traceable to standards of NIST, and adequate for making positive observation of test results. Make calibration records available for examination on request.
 - E. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 - F. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - G. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - H. Remove and replace malfunctioning units and retest and reinspect as specified above.
 - I. Retest: Correct deficiencies identified by tests and observations and retest until specified requirements are met.
 - J. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation resistances, time delays, and other values and observations. Attach a label or tag to each tested component indicating satisfactory completion of tests.

3.6 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain packaged engine generators. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION

SECTION 263600 - TRANSFER SWITCHES

PART 1 - GENERAL

1.1 ACTION SUBMITTALS

- A. Coordination of Submittals: Include preliminary power system studies with submittal or submit to Architect prior to submittal. Refer to Section 260573 "Power System Studies" for additional requirements. Transfer switches submitted prior to preliminary power system studies will be returned without review.
- B. Product Data: For each type of product.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for transfer switches.
 - 2. Include rated capacities, operating characteristics, electrical characteristics, and accessories.
- C. Shop Drawings:
 - 1. Include plans, elevations, sections, details showing minimum clearances, conductor entry provisions, gutter space, and installed features and devices.
 - 2. Include material lists for each switch specified.
 - 3. Single-Line Diagram: Show connections between transfer switch, bypass/isolation switch, power sources, and load; and show interlocking provisions for each combined transfer switch and bypass/isolation switch.
 - 4. Riser Diagram: Show interconnection wiring between transfer switches, bypass/isolation switches, annunciators, and control panels.

1.2 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For **manufacturer-authorized service representative**.
- B. Seismic Qualification Data: Certificates, for transfer switches, accessories, and components, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- C. Field quality-control reports.

1.3 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals.
 - 1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:
 - a. Features and operating sequences, both automatic and manual.
 - b. List of all factory settings of relays; provide relay-setting and calibration instructions, including software, where applicable.

1.4 QUALITY ASSURANCE

- A. Testing Agency Qualifications:

1. Member company of NETA.
 - a. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.5 WARRANTY

- A. Manufacturer's Warranty: Manufacturer agrees to repair or replace components of transfer switch or transfer switch components that fail in materials or workmanship within specified warranty period.
 1. Warranty Period: 18 months from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NEMA ICS 1.
- C. Comply with NFPA 99.
- D. Comply with NFPA 110.
- E. Comply with UL 1008 unless requirements of these Specifications are stricter.
- F. Indicated Current Ratings: Apply as defined in UL 1008 for continuous loading and total system transfer, including tungsten filament lamp loads not exceeding 30 percent of switch ampere rating, unless otherwise indicated.
- G. Tested Fault-Current Closing and Short-Circuit Ratings: Adequate for duty imposed by protective devices at installation locations in Project under the fault conditions indicated, based on testing according to UL 1008.
 1. Where transfer switch includes internal fault-current protection, rating of switch and trip unit combination shall exceed indicated fault-current value at installation location.
 2. Short-time withstand capability for **3** cycles.
- H. Repetitive Accuracy of Solid-State Controls: All settings shall be plus or minus 2 percent or better over an operating temperature range of minus 20 to plus 70 deg C.
- I. Resistance to Damage by Voltage Transients: Components shall meet or exceed voltage-surge withstand capability requirements when tested according to IEEE C62.62. Components shall meet or exceed voltage-impulse withstand test of NEMA ICS 1.
- J. Electrical Operation: Accomplish by a nonfused, momentarily energized solenoid or electric-motor-operated mechanism. Switches for emergency or standby purposes shall be mechanically and electrically interlocked in both directions to prevent simultaneous connection to both power sources unless closed transition.
- K. Service-Rated Transfer Switch:
 1. Comply with UL 869A and UL 489.
 2. Provide terminals for bonding the grounding electrode conductor to the grounded service conductor.
 3. In systems with a neutral, the bonding connection shall be on the neutral bus.
 4. Provide removable link for temporary separation of the service and load grounded conductors.
 5. Surge Protective Device: Service rated.

6. Ground-Fault Protection: Comply with UL 1008 for normal bus.
7. Service Disconnecting Means: Externally operated, manual electrically actuated.

- L. Neutral Switching: Where four-pole switches are indicated, provide neutral pole switched simultaneously with phase poles.

- M. Neutral Terminal: Solid and fully rated unless otherwise indicated.

- N. Oversize Neutral: Ampacity and switch rating of neutral path through units indicated for oversize neutral shall be double the nominal rating of circuit in which switch is installed.

- O. Heater: Equip switches exposed to outdoor temperatures and humidity, and other units indicated, with an internal heater. Provide thermostat within enclosure to control heater.

- P. Battery Charger: For generator starting batteries.
 1. Float type, rated **2** A.
 2. Ammeter to display charging current.
 3. Fused ac inputs and dc outputs.

- Q. Annunciation, Control, and Programming Interface Components: Devices at transfer switches for communicating with remote programming devices, annunciators, or annunciator and control panels shall have communication capability matched with remote device.

- R. Factory Wiring: Train and bundle factory wiring and label, consistent with Shop Drawings, by color-code or by numbered or lettered wire and cable with printed markers at terminations. Color-coding and wire and cable markers are specified in Section 260553 "Identification for Electrical Systems."
 1. Designated Terminals: Pressure type, suitable for types and sizes of field wiring indicated.
 2. Power-Terminal Arrangement and Field-Wiring Space: Suitable for top, side, or bottom entrance of feeder conductors as indicated.
 3. Control Wiring: Equipped with lugs suitable for connection to terminal strips.
 4. Accessible via **rear** access.

- S. Enclosures: General-purpose NEMA 250, Type 1, complying with NEMA ICS 6 and UL 508, unless otherwise indicated.

2.2 CONTACTOR-TYPE AUTOMATIC TRANSFER SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Caterpillar, Inc.; Electric Power Division.
 2. Cummins Power Generation.
 3. Eaton.
 4. ASCO Power Technologies.
 5. Generac Power Systems, Inc.
 6. MTU Onsite Energy Corporation.
 7. Russelectric, Inc.
 8. ABB.

- B. Comply with Level 1 equipment according to NFPA 110.

- C. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.
 1. Limitation: Switches using molded-case switches or circuit breakers or insulated-case circuit-breaker components are unacceptable.
 2. Switch Action: Double throw; mechanically held in both directions.
 3. Contacts: Silver composition or silver alloy for load-current switching. Contactor-style automatic transfer-switch units, rated 600 A and higher, shall have separate arcing contacts.

4. Conductor Connectors: Suitable for use with conductor material and sizes.
 5. Material: Tin-plated aluminum Hard-drawn copper, 98 percent conductivity.
 6. Main and Neutral Lugs: Compression Mechanical type.
 7. Ground Lugs and Bus-Configured Terminators: Compression Mechanical type.
 8. Connectors shall be marked for conductor size and type according to UL 1008.
- D. Automatic Open-Transition Transfer Switches: Interlocked to prevent the load from being closed on both sources at the same time.
1. Sources shall be mechanically and electrically interlocked to prevent closing both sources on the load at the same time.
- E. Manual Switch Operation: Under load, with door closed and with either or both sources energized. Transfer time is same as for electrical operation. Control circuit automatically disconnects from electrical operator during manual operation.
- F. Signal-Before-Transfer Contacts: A set of normally open/normally closed dry contacts operates in advance of retransfer to normal source. Interval shall be adjustable from 1 to 30 seconds.
- G. Digital Communication Interface: Matched to capability of remote annunciator or annunciator and control panel.
- H. Automatic Transfer-Switch Controller Features:
1. Controller operates through a period of loss of control power.
 2. Undervoltage Sensing for Each Phase of Normal Source: Sense low phase-to-ground voltage on each phase. Pickup voltage shall be adjustable from 85 to 100 percent of nominal, and dropout voltage shall be adjustable from 75 to 98 percent of pickup value. Factory set for pickup at 90 percent and dropout at 85 percent.
 3. Voltage/Frequency Lockout Relay: Prevent premature transfer to generator. Pickup voltage shall be adjustable from 85 to 100 percent of nominal. Factory set for pickup at 90 percent. Pickup frequency shall be adjustable from 90 to 100 percent of nominal. Factory set for pickup at 95 percent.
 4. Time Delay for Retransfer to Normal Source: Adjustable from zero to 30 minutes, and factory set for 10 minutes. Override shall automatically defeat delay on loss of voltage or sustained undervoltage of emergency source, provided normal supply has been restored.
 5. Test Switch: Simulate normal-source failure.
 6. Switch-Position Pilot Lights: Indicate source to which load is connected.
 7. Source-Available Indicating Lights: Supervise sources via transfer-switch normal- and emergency-source sensing circuits.
 - a. Normal Power Supervision: Green light with nameplate engraved "Normal Source Available."
 - b. Emergency Power Supervision: Red light with nameplate engraved "Emergency Source Available."
 8. Unassigned Auxiliary Contacts: Two normally open, single-pole, double-throw contacts for each switch position, rated 10 A at 240-V ac.
 9. Transfer Override Switch: Overrides automatic retransfer control so transfer switch will remain connected to emergency power source regardless of condition of normal source. Pilot light indicates override status.
 10. Engine Starting Contacts: One isolated and normally closed, and one isolated and normally open; rated 10 A at 32-V dc minimum.
 11. Engine Shutdown Contacts: Instantaneous; shall initiate shutdown sequence at remote engine-generator controls after retransfer of load to normal source.
 12. Engine-Generator Exerciser: Solid-state, programmable-time switch starts engine generator and transfers load to it from normal source for a preset time, then retransfers and shuts down engine after a preset cool-down period. Initiates exercise cycle at preset intervals adjustable from 7 to 30 days. Running periods shall be adjustable from 10 to 30 minutes. Factory settings shall be for 7-day exercise cycle, 20-minute running period, and 5-minute cool-down period. Exerciser features include the following:

- a. Exerciser Transfer Selector Switch: Permits selection of exercise with and without load transfer.
 - b. Push-button programming control with digital display of settings.
 - c. Integral battery operation of time switch when normal control power is unavailable.
- I. Large-Motor-Load Power Transfer:
1. In-Phase Monitor: Factory-wired, internal relay controls transfer so contacts close only when the two sources are synchronized in phase and frequency. Relay shall compare phase relationship and frequency difference between normal and emergency sources and initiate transfer when both sources are within 15 electrical degrees, and only if transfer can be completed within 60 electrical degrees. Transfer shall be initiated only if both sources are within 2 Hz of nominal frequency and 70 percent or more of nominal voltage.
 2. Motor Disconnect and Timing Relay Controls: Designated starters in loss of power scenario shall disconnect motors before transfer and reconnect them selectively at an adjustable time interval after transfer. Control connection to motor starters shall be through wiring external to automatic transfer switch. Provide adjustable time delay between 1 and 60 seconds for reconnecting individual motor loads. Provide relay contacts rated for motor-control circuit inrush and for actual seal currents to be encountered.
 3. Programmed Neutral Switch Position: Switch operator with programmed neutral position arranged to provide a midpoint between the two working switch positions, with an intentional, time-controlled pause at midpoint during transfer. Adjustable pause from 0.5 to 30 seconds minimum, and factory set for 0.5 second unless otherwise indicated. Time delay occurs for both transfer directions. Disable pause unless both sources are live.

2.3 MOLDED-CASE-TYPE AUTOMATIC TRANSFER SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Caterpillar, Inc.; Electric Power Division.
 2. Cummins Power Generation.
 3. Eaton.
 4. ABB.
 5. Generac Power Systems, Inc.
- B. Comply with Level 1 equipment according to NFPA 110.
- C. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.
1. Limitation: Switches using contactor-based components are unacceptable.
 2. Switch Action: Double throw; mechanically held in both directions.
 3. Contacts: Silver composition or silver alloy for load-current switching.
 4. Conductor Connectors: Suitable for use with conductor material and sizes.
 5. Material: Tin-plated aluminum Hard-drawn copper, 98 percent conductivity.
 6. Main and Neutral Lugs: Compression Mechanical type.
 7. Ground Lugs and Bus-Configured Terminators: Compression Mechanical type.
 8. Ground bar.
 9. Connectors shall be marked for conductor size and type according to UL 1008.
- D. Automatic Open-Transition Transfer Switches: Interlocked to prevent the load from being closed on both sources at the same time.
1. Sources shall be mechanically and electrically interlocked to prevent closing both sources on the load at the same time.
- E. Manual Switch Operation: Under load, with door closed and with either or both sources energized. Transfer time is same as for electrical operation. Control circuit automatically disconnects from electrical operator during manual operation.

- F. Signal-Before-Transfer Contacts: A set of normally open/normally closed dry contacts operates in advance of retransfer to normal source. Interval shall be adjustable from 1 to 30 seconds.
- G. Digital Communication Interface: Matched to capability of remote annunciator or annunciator and control panel.
- H. Transfer Switches Based on Molded-Case-Switch Components: Comply with UL 489 and UL 869A.
- I. Automatic Transfer-Switch Controller Features:
 - 1. Controller operates through a period of loss of control power.
 - 2. Undervoltage Sensing for Each Phase of Normal Source: Sense low phase-to-ground voltage on each phase. Pickup voltage shall be adjustable from 85 to 100 percent of nominal, and dropout voltage shall be adjustable from 75 to 98 percent of pickup value. Factory set for pickup at 90 percent and dropout at 85 percent.
 - 3. Voltage/Frequency Lockout Relay: Prevent premature transfer to generator. Pickup voltage shall be adjustable from 85 to 100 percent of nominal. Factory set for pickup at 90 percent. Pickup frequency shall be adjustable from 90 to 100 percent of nominal. Factory set for pickup at 95 percent.
 - 4. Time Delay for Retransfer to Normal Source: Adjustable from zero to 30 minutes, and factory set for 10 minutes. Override shall automatically defeat delay on loss of voltage or sustained undervoltage of emergency source, provided normal supply has been restored.
 - 5. Test Switch: Simulate normal-source failure.
 - 6. Switch-Position Pilot Lights: Indicate source to which load is connected.
 - 7. Source-Available Indicating Lights: Supervise sources via transfer-switch normal- and emergency-source sensing circuits.
 - a. Normal Power Supervision: Green light with nameplate engraved "Normal Source Available."
 - b. Emergency Power Supervision: Red light with nameplate engraved "Emergency Source Available."
 - 8. Unassigned Auxiliary Contacts: Two normally open, single-pole, double-throw contacts for each switch position, rated 10 A at 240-V ac.
 - 9. Transfer Override Switch: Overrides automatic retransfer control so automatic transfer switch will remain connected to emergency power source regardless of condition of normal source. Pilot light indicates override status.
 - 10. Engine Starting Contacts: One isolated and normally closed, and one isolated and normally open; rated 10 A at 32-V dc minimum.
 - 11. Engine Shutdown Contacts: Instantaneous; shall initiate shutdown sequence at remote engine-generator controls after retransfer of load to normal source.
 - 12. Engine Shutdown Contacts: Time delay adjustable from zero to five minutes, and factory set for five minutes. Contacts shall initiate shutdown at remote engine-generator controls after retransfer of load to normal source.
 - 13. Engine-Generator Exerciser: Solid-state, programmable-time switch starts engine generator and transfers load to it from normal source for a preset time, then retransfers and shuts down engine after a preset cool-down period. Initiates exercise cycle at preset intervals adjustable from 7 to 30 days. Running periods shall be adjustable from 10 to 30 minutes. Factory settings shall be for 7-day exercise cycle, 20-minute running period, and 5-minute cool-down period. Exerciser features include the following:
 - a. Exerciser Transfer Selector Switch: Permits selection of exercise with and without load transfer.
 - b. Push-button programming control with digital display of settings.
 - c. Integral battery operation of time switch when normal control power is unavailable.
- J. Large-Motor-Load Power Transfer:

1. In-Phase Monitor: Factory-wired, internal relay controls transfer so contacts close only when the two sources are synchronized in phase and frequency. Relay shall compare phase relationship and frequency difference between normal and emergency sources and initiate transfer when both sources are within 15 electrical degrees, and only if transfer can be completed within 60 electrical degrees. Transfer shall be initiated only if both sources are within 2 Hz of nominal frequency and 70 percent or more of nominal voltage.
2. Motor Disconnect and Timing Relay Controls: Designated starters in loss of power scenario shall disconnect motors before transfer and reconnect them selectively at an adjustable time interval after transfer. Control connection to motor starters shall be through wiring external to automatic transfer switch. Provide adjustable time delay between 1 and 60 seconds for reconnecting individual motor loads. Provide relay contacts rated for motor-control circuit inrush and for actual seal currents to be encountered.
3. Programmed Neutral Switch Position: Switch operator with programmed neutral position arranged to provide a midpoint between the two working switch positions, with an intentional, time-controlled pause at midpoint during transfer. Adjustable pause from 0.5 to 30 seconds minimum, and factory set for 0.5 second unless otherwise indicated. Time delay occurs for both transfer directions. Disable pause unless both sources are live.

2.4 NONAUTOMATIC TRANSFER SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. ASCO Power Technologies.
 2. Caterpillar, Inc.; Electric Power Division.
 3. Eaton.
 4. ESL Power Systems, Inc.
 5. Russelectric, Inc.
- B. Electrically Operated: Electrically actuated by push buttons designated "Normal Source" and "Alternative Source." Switch shall be capable of transferring load in either direction with either or both sources energized.
- C. Manual and Electrically Operated: Electrically actuated by push buttons designated "Normal Source" and "Alternative Source." Manual handle provides quick-make, quick-break manual-switching action. Switch shall be capable of electrically or manually transferring load in either direction with either or both sources energized. Control circuit disconnects from electrical operator during manual operation.
- D. Double-Throw Switching Arrangement: Incapable of pauses or intermediate position stops during switching sequence.
- E. Pilot Lights: Indicate source to which load is connected.
- F. Source-Available Indicating Lights: Supervise sources via transfer-switch normal- and alternative-source sensing circuits.
 1. Normal Power Supervision: Green light with nameplate engraved "Normal Source Available."
 2. Emergency Power Supervision: Red light with nameplate engraved "Alternative Source Available."
- G. Unassigned Auxiliary Contacts: Switch shall have one set of normally closed contacts for each switch position, rated 10 A at 240-V ac.
- H. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.
 1. Switch Action: Double throw; mechanically held in both directions.
 2. Contacts: Silver composition or silver alloy for load-current switching.
 3. Conductor Connectors: Suitable for use with conductor material and sizes.
 4. Material: Tin-plated aluminum Hard-drawn copper, 98 percent conductivity.
 5. Main and Neutral Lugs: Compression Mechanical type.

6. Ground Lugs and Bus-Configured Terminators: Compression Mechanical type.
7. Connectors shall be marked for conductor size and type according to UL 1008.

2.5 TRANSFER SWITCH ACCESSORIES

A. Bypass/Isolation Switches:

1. Source Limitations: Same manufacturer as transfer switch in which installed.
2. Comply with requirements for Level 1 equipment according to NFPA 110.
3. Description: Manual type, arranged to select and connect either source of power directly to load, isolating transfer switch from load and from both power sources. Include the following features for each combined automatic transfer switch and bypass/isolation switch:
 - a. Means to lock bypass/isolation switch in the position that isolates transfer switch with an arrangement that permits complete electrical testing of transfer switch while isolated. Interlocks shall prevent transfer-switch operation, except for testing or maintenance, while automatic transfer switch is isolated.
 - b. Provide means to make power available to transfer-switch control circuit for testing and maintenance purposes.
 - c. Drawout Arrangement for Transfer Switch: Provide physical separation from live parts and accessibility for testing and maintenance operations. Transfer switch and bypass/isolation switch shall be in isolated compartments.
 - d. Transition: Provide closed-transition operation when transferring from main transfer switch to bypass/isolation switch on the same power source.
 - e. Bypass/Isolation Switch Current, Voltage, Closing, and Short-Circuit Withstand Ratings: Equal to or greater than those of associated automatic transfer switch, and with same phase arrangement and number of poles.
 - f. Contact temperatures of bypass/isolation switches shall not exceed those of automatic transfer-switch contacts when they are carrying rated load.
 - g. Manual Control: Constructed so load bypass and transfer-switch isolation can be performed by one person in no more than two operations in 15 seconds or less. Operating handles shall be externally operated.
 - h. Legend: Manufacturer's standard legend for control labels and instruction signs shall describe operating instructions.
 - i. Maintainability: Fabricate to allow convenient removal of major components from front without removing other parts or main power conductors.
4. Interconnection of Bypass/Isolation Switches with Automatic Transfer Switches: Factory-installed copper bus bars; plated at connection points and braced for the indicated available short-circuit current.

B. Remote Annunciator System:

1. Source Limitations: Same manufacturer as transfer switch in which installed.
2. Functional Description: Remote annunciator panel shall annunciate conditions for indicated transfer switches.
3. Annunciator panel display shall include the following indicators:
 - a. Sources available, as defined by actual pickup and dropout settings of transfer-switch controls.
 - b. Switch position.
 - c. Switch in test mode.
 - d. Failure of communication link.
4. Annunciator Panel: LED-lamp type with audible signal and silencing switch.
 - a. Indicating Lights: Grouped for each transfer switch monitored.
 - b. Label each group, indicating transfer switch it monitors, location of switch, and identity of load it serves.
 - c. Mounting: Flush, modular, steel cabinet unless otherwise indicated.
 - d. Lamp Test: Push-to-test or lamp-test switch on front panel.

C. Remote Annunciator and Control System:

1. Source Limitations: Same manufacturer as transfer switch in which installed.
2. Include the following functions for indicated transfer switches:
 - a. Indication of sources available, as defined by actual pickup and dropout settings of transfer-switch controls.
 - b. Indication of switch position.
 - c. Indication of switch in test mode.
 - d. Indication of failure of digital communication link.
 - e. Key-switch or user-code access to control functions of panel.
 - f. Control of switch-test initiation.
 - g. Control of switch operation in either direction.
 - h. Control of time-delay bypass for transfer to normal source.
3. Malfunction of annunciator, annunciation and control panel, or communication link shall not affect functions of automatic transfer switch. In the event of failure of communication link, automatic transfer switch automatically shall revert to standalone, self-contained operation. Automatic transfer-switch sensing, controlling, or operating function shall not depend on remote panel for proper operation.
4. Remote Annunciation and Control Panel: Solid-state components. Include the following features:
 - a. Controls and indicating lights grouped together for each transfer switch.
 - b. Label each indicating light control group. Indicate transfer switch it controls, location of switch, and load it serves.
 - c. Digital Communication Capability: Matched to that of transfer switches supervised.
 - d. Mounting: Flush, modular, steel cabinet unless otherwise indicated.

D. Digital Power Meter

1. Mounting: Flush in front door of transfer switch
2. Display: Digital LCD
3. Metered Parameters:
 - a. LL/LN Voltage
 - b. A,B,C, N Currents
 - c. Power (kW, kVA, kVAR)
 - d. Power Factor
 - e. Frequency
 - f. kW Demand
 - g. Accumulated Energy (kWh, kVAh, kVARh)
 - h. Total Harmonic Distortion (THD)
 - i. Min/max historical values
4. Accuracy:
 - a. Current, Voltage, Power, Frequency: 1.0%
 - b. Energy, Power Factor, Demand: 1.0%
5. Displaying of each of the metered quantities shall be accomplished through the use of menu scroll buttons.
6. Reset of stored historical values and accumulated values shall be performed through the local access display. All reset functions shall have a means for protection against unauthorized/accidental changes.
7. Provide current transformers as required to provide specified metering functions and accuracy.

2.6 SOURCE QUALITY CONTROL

- A. Factory Tests: Test and inspect components, assembled switches, and associated equipment according to UL 1008. Ensure proper operation. Check transfer time and voltage, frequency, and time-delay settings for compliance with specified requirements. Perform dielectric strength test complying with NEMA ICS 1.

- B. Prepare test and inspection reports.
 - 1. For each of the tests required by UL 1008, performed on representative devices, for **emergency** systems. Include results of test for the following conditions:
 - a. Overvoltage.
 - b. Undervoltage.
 - c. Loss of supply voltage.
 - d. Reduction of supply voltage.
 - e. Alternative supply voltage or frequency is at minimum acceptable values.
 - f. Temperature rise.
 - g. Dielectric voltage-withstand; before and after short-circuit test.
 - h. Overload.
 - i. Contact opening.
 - j. Endurance.
 - k. Short circuit.
 - l. Short-time current capability.
 - m. Receptacle withstand capability.
 - n. Insulating base and supports damage.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Floor-Mounting Switch: Anchor to floor by bolting.
 - 1. Install transfer switches on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
 - 2. Comply with requirements for seismic control devices specified in Section 260548.16 "Seismic Controls for Electrical Systems."
 - 3. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases.
 - 4. Provide workspace and clearances required by NFPA 70.
- B. Annunciator and Control Panel Mounting: Flush in wall unless otherwise indicated.
- C. Identify components according to Section 260553 "Identification for Electrical Systems."
- D. Set field-adjustable intervals and delays, relays, and engine exerciser clock.

3.2 CONNECTIONS

- A. Wiring to Remote Components: Match type and number of cables and conductors to generator sets, control, and communication requirements of transfer switches as recommended by manufacturer. Increase raceway sizes at no additional cost to Owner if necessary to accommodate required wiring.
- B. Wiring Method: Install cables in raceways and cable trays except within electrical enclosures. Conceal raceway and cables except in unfinished spaces.
 - 1. Comply with requirements for raceways and boxes specified in Section 260533 "Raceways and Boxes for Electrical Systems."
- C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.
- D. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
- E. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

- F. Connect twisted pair cable according to Section 260513 "Low-Voltage Electrical Power Conductors and Cables."
- G. Connect twisted pair cable according to manufacturer's installation instructions.
- H. Route and brace conductors according to manufacturer's written instructions and Section 260529 "Hangers and Supports for Electrical Systems." Do not obscure manufacturer's markings and labels.
- I. Brace and support equipment according to Section 260548.16 "Seismic Controls for Electrical Systems."
- J. Final connections to equipment shall be made with liquidtight, flexible metallic conduit no more than 18 inches in length.

3.3 FIELD QUALITY CONTROL

- A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- C. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 - 1. After installing equipment, test for compliance with requirements according to NETA ATS.
 - 2. Visual and Mechanical Inspection:
 - a. Compare equipment nameplate data with Drawings and Specifications.
 - b. Inspect physical and mechanical condition.
 - c. Inspect anchorage, alignment, grounding, and required clearances.
 - d. Verify that the unit is clean.
 - e. Verify appropriate lubrication on moving current-carrying parts and on moving and sliding surfaces.
 - f. Verify that manual transfer warnings are attached and visible.
 - g. Verify tightness of all control connections.
 - h. Inspect bolted electrical connections for high resistance using one of the following methods, or both:
 - 1) Use of low-resistance ohmmeter.
 - 2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method according to manufacturer's published data.
 - i. Perform manual transfer operation.
 - j. Verify positive mechanical interlocking between normal and alternate sources.
 - k. Perform visual and mechanical inspection of surge arresters.
 - l. Inspect control power transformers.
 - 1) Inspect for physical damage, cracked insulation, broken leads, tightness of connections, defective wiring, and overall general condition.
 - 2) Verify that primary and secondary fuse or circuit-breaker ratings match Drawings.
 - 3) Verify correct functioning of drawout disconnecting contacts, grounding contacts, and interlocks.
 - 3. Electrical Tests:
 - a. Perform insulation-resistance tests on all control wiring with respect to ground.
 - b. Perform a contact/pole-resistance test. Compare measured values with manufacturer's acceptable values.
 - c. Verify settings and operation of control devices.
 - d. Calibrate and set all relays and timers.
 - e. Verify phase rotation, phasing, and synchronized operation.
 - f. Perform automatic transfer tests.

- g. Verify correct operation and timing of the following functions:
 - 1) Normal source voltage-sensing and frequency-sensing relays.
 - 2) Engine start sequence.
 - 3) Time delay on transfer.
 - 4) Alternative source voltage-sensing and frequency-sensing relays.
 - 5) Automatic transfer operation.
 - 6) Interlocks and limit switch function.
 - 7) Time delay and retransfer on normal power restoration.
 - 8) Engine cool-down and shutdown feature.
 - 4. Measure insulation resistance phase-to-phase and phase-to-ground with insulation-resistance tester. Include external annunciation and control circuits. Use test voltages and procedure recommended by manufacturer. Comply with manufacturer's specified minimum resistance.
 - a. Check for electrical continuity of circuits and for short circuits.
 - b. Inspect for physical damage, proper installation and connection, and integrity of barriers, covers, and safety features.
 - c. Verify that manual transfer warnings are properly placed.
 - d. Perform manual transfer operation.
 - 5. After energizing circuits, perform each electrical test for transfer switches stated in NETA ATS and demonstrate interlocking sequence and operational function for each switch at least three times.
 - a. Simulate power failures of normal source to automatic transfer switches and retransfer from emergency source with normal source available.
 - b. Simulate loss of phase-to-ground voltage for each phase of normal source.
 - c. Verify time-delay settings.
 - d. Verify pickup and dropout voltages by data readout or inspection of control settings.
 - e. Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
 - f. Perform contact-resistance test across main contacts and correct values exceeding 500 microhms and values for one pole deviating by more than 50 percent from other poles.
 - g. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.
 - 6. Ground-Fault Tests: Coordinate with testing of ground-fault protective devices for power delivery from both sources.
 - a. Verify grounding connections and locations and ratings of sensors.
 - D. Coordinate tests with tests of generator and run them concurrently.
 - E. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation and contact resistances and time delays. Attach a label or tag to each tested component indicating satisfactory completion of tests.
 - F. Transfer switches will be considered defective if they do not pass tests and inspections.
 - G. Remove and replace malfunctioning units and retest as specified above.
 - H. Prepare test and inspection reports.
- 3.4 DEMONSTRATION**
- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain transfer switches and related equipment.
 - B. Training shall include testing ground-fault protective devices and instructions to determine when the ground-fault system shall be retested. Include instructions on where ground-fault sensors are located and how to avoid negating the ground-fault protection scheme during testing and circuit modifications.

- C. Coordinate this training with that for generator equipment.

END OF SECTION 263600

SECTION 263650 - GENERATOR DOCKING STATIONS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes generator docking stations (also referred to as quick-connect panels) rated 600V and less.

1.2 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for transfer switches
 - 2. Include rated capacities, operating characteristics, electrical characteristics, and accessories.
- B. Shop Drawings:
 - 1. Include plans, elevations, sections, details showing minimum clearances, conductor entry provisions, gutter space, and installed features and devices.
 - 2. Include material lists for each switch specified.
 - 3. Single-Line Diagram: Show connections between permanent generator, temporary generator, automatic transfer switch. Show interlocking provisions as specified.
 - 4. Riser Diagram: Show interconnection wiring between docking station, remote transfer switches, power sources, power distribution equipment, remote start contacts, remote alarm and control panels.

1.3 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For manufacturer-authorized service representative
- B. Field quality-control reports.

1.4 CLOSEOUT SUBMITTALS

- A. Operations and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- B. Comply with NFPA 70.
- C. Comply with NFPA 110.

1.6 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

1.7 WARRANTY

- A. The equipment installed under this contract shall be left in proper working order.

- B. New materials and equipment shall be guaranteed against defects in composition, design or workmanship. Guarantee certificates shall be furnished.

PART 2 - PRODUCTS

2.1 GENERATOR DOCKING STATION

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Trystar
 - 2. Powertron
 - 3. ASCO
 - 4. Eaton
 - 5. ESL Power Systems

2.2 GENERAL REQUIREMENTS

- A. Docking station shall include 16 Series Camlok Panel Mounts for use as connection to Portable Generator and/or Temporary Load Bank as indicated on Drawings.
- B. Entire package must be listed to ETL or UL 1008 Standards. UL listing of individual components is not acceptable.
- C. Enclosures:
 - 1. NEMA 3R4X enclosure.
 - a. Pad-lockable front door shall include a hinged access plate at the bottom for entry of cables from portable generator or portable load bank. NEMA integrity shall be maintained with access plate open for cable entry.
 - b. Front and side through a front access panel shall be accessible for maintenance.
 - c. Top, side, and bottom through a front access panel shall be accessible for permanent cabling.
 - 2. Finishes:
 - a. Paint after fabrication. Powder coated manufacturer's standard greycustom color to be selected by Architect.
- D. Phase, Neutral, and Ground Buses:
 - 1. Material: Tin-plated or Silver-plated Copper
 - 2. Equipment Ground Bus: bonded to box.
 - 3. Ground Bus: 50% of phase size.
 - 4. Neutral Bus: Neutral bus rated 100 percent of phase bus.
- E. Temporary generator connectors shall be Camlok style mounted on gland plate.
 - 1. Camlok shall be color coded according to system voltage
 - a. A phase: Black (208/120V) or Brown (480/277V)
 - b. B phase: Red (208/120V) or Orange (480/277V)
 - c. C phase: Blue (208/120V) or Yellow (480/277V)
 - d. N Neutral: White
 - e. G Ground: Green
- F. Temporary load bank connectors shall be Camlok style mounted on gland plate.
 - 1. Camlok shall be color coded according to system voltage
 - a. A phase: Black (208/120V) or Brown (480/277V)
 - b. B phase: Red (208/120V) or Orange (480/277V)
 - c. C phase: Blue (208/120V) or Yellow (480/277V)

- d. G Ground: Green
- G. Temporary connectors shall include protective flip lids to prevent accidental contact.
- H. Permanent connectors shall be broad range set-screw type, located behind an aluminum barrier.
- I. Short Circuit & Withstand Rating
 - 1. 65kAIC minimum, unless otherwise indicated on drawings.
- J. Voltage:
 - 1. 480/277V
- K. Current Rating:
 - 1. As indicated on Drawings
- L. Phase Rotation Monitor Device:
 - 1. Phase monitoring relay to be Siemens 3U4512-1AR20 or equal.
- M. Circuit Breakers:
 - 1. UL 489 Listed
 - 2. Circuit breakers shall be removable for service and maintenance
 - 3. Circuit breakers rated 1200A or greater shall contain a maintenance mode switch which complies with NFPA 70 Article 240 arc energy reduction requirements. The maintenance mode switch shall temporarily modify the trip settings of the circuit breaker to reduce the available arc energy downstream of the circuit breaker.
 - 4. Circuit breakers for load bank connectors shall have a shunt trip coil, and shall be wired to trip the circuit breaker when a start signal is received from the transfer switch.
- N. Additional accessories shall be included in submittal drawings as follows:
 - 1. Two-wire auto-start
 - 2. Battery charger receptacle, NEMA 5-20R
 - 3. Battery charger receptacle, NEMA 5-20R, GFCI
 - 4. Block heater receptacle
 - 5. Extra-depth for bottom conduit entry.
 - 6. Kirk key door interlock
 - 7. Strip heater and thermostat
 - 8. Surge protection device
 - 9. Load dump receptacle
 - 10. Utility light.
 - 11. Alarm contacts to indicate that the permanent emergency source is disconnected from the emergency system. Contacts shall change state when the generator feed circuit breaker is in the open position.

2.3 ALARM PANEL

- A. Description: Annunciator/alarm panel to indicate that the permanent emergency source is disconnected from the emergency system
- B. Features:
 - 1. Enclosure: Steel, flush or surface mountable
 - 2. Indicating Light: Red LED
 - 3. Buzzer
 - 4. Silence Button
 - 5. Operating Voltage: 24VDC

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine elements and surfaces to receive Generator Docking Station for compliance with installation tolerances and other conditions affecting performance of the Work.

3.2 INSTALLATION

- A. Surface, Flush or Base Mounted: Determined by Application
 - 1. Concrete bases: 4 inches high above finished grade, reinforced, with chamfered edges. Extend base no more than 4 inches in all directions beyond the maximum dimensions of the enclosure. Construct concrete bases according to Division 26 Section "Hangers and Supports for Electrical Systems." Install anchor bolts to elevations required for proper attachment to Generator Docking Station.
- B. Power Wiring: Make connections to power distribution system as indicated on Drawings. Install wiring as required by Section 260519: "Low Voltage Power Conductors and Cables."
- C. Control Wiring: Install wiring as required by Section 260519: "Low Voltage Power Conductors and Cables."
 - 1. Start Circuit: Provide 2-wire start circuit wiring to the emergency system transfer switch(es) for installations where the generator docking station is connected to the emergency power system. Terminate 2-wire start circuit wiring at a terminal block inside generator docking station and label "Generator Start Circuit."
 - 2. Alarm Panel: Provide wiring from the docking station to the alarm panel. Where the alarm panel requires an external power source, provide a dedicated 120V circuit from a spare circuit breaker in the nearest panelboard.

3.3 FIELD QUALITY CONTROL

- A. Tests and Inspections to include the following:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
- B. Prepare test and inspection reports, including a certified report that identifies Generator Docking Station and that describes test and inspection results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

END OF SECTION 262550

SECTION 264200 – CATHODIC PROTECTION

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This section specifies complete galvanic sacrificial anode type cathodic protection systems for underground steel tanks and piping. The section also includes devices to electrically isolate the system being protected.
- B. The services required include planning, installation, adjusting and testing of a cathodic protection system, using sacrificial anodes for cathodic protection of the Water, Fire Protection and Natural Gas line piping and above-ground appurtenances. The cathodic protection system shall include anodes, cables, connectors, corrosion protection test stations, and any other equipment required for a complete operating system providing the NACE criteria of protection as specified. Insulators are required whenever needed to insulate the pipes from any other structure. Any pipe crossing the water, fire protection, natural gas pipe shall have a test station.

1.2 RELATED WORK

- A. Section 33 10 00, WATER SYSTEMS

1.3 QUALITY ASSURANCE

- A. The Contractor shall be regularly engaged in the installation and testing of cathodic protection systems. Contractor's personnel shall be experienced, and shall be supervised by an engineer who is accredited as a Corrosion Specialist or Cathodic Protection Specialist by the National Association of Corrosion Engineers (NACE) International.
- B. Cathodic protection for underground metal piping tanks shall be designed in accordance with NACE SP0169-2013.

1.4 SUBMITTALS

- A. In accordance with the following requirements:
 - 1. Design Submittal: For cathodic protection system indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the corrosion engineer responsible for their preparation.
 - a. Conduct site tests necessary for design, including soil resistivity, close-interval potential surveys, testing during construction, interference testing, and training of District's personnel.
 - b. Provide system design calculations, stating the maximum recommended anode current output density, and the rate of gaseous production, if any, at that current density.
 - 2. Furnish catalog cuts and shop drawings for the following items:
 - a. Anodes.
 - b. Cable and wire.
 - c. Test stations.
 - d. Terminal boxes.
 - e. Isolating flanges, unions, coatings, casing seals.
 - f. Exothermic welding devices.
 - g. Cable splice kits.
 - h. Layout drawings, wiring diagrams.
 - i. Test instruments.
 - j. Dielectric tape.
 - k. Test connection points.

3. Detail drawings consisting of a complete list of equipment and material and complete wiring and schematic diagrams, as well as any other details required to demonstrate that the system will function properly.
4. Designer's accreditation as a Corrosion Specialist or Cathodic Protection Specialist by NACE International.
5. Test reports in booklet form tabulating all field tests and measurements performed, upon completion and testing of the installed system and including close interval potential survey, casing and interference tests, final system test verifying protection, insulated joint and bond tests, and holiday coating test. A certified test report showing that the connecting method has passed a 120-day laboratory test without failure at the place of connection, wherein the anode is subjected to maximum recommended current output while immersed in a three percent sodium chloride solution.
6. Operation and Maintenance Manual:
 - a. Basic system operation.
 - b. Instructions for dielectric connections, interference and sacrificial-anode bonds; and precautions to ensure safe conditions during repair of pipe, tank or other metallic systems.
 - c. Locations of all anodes, test stations, and insulating joints.
 - d. Structure-to-reference cell potentials.
 - e. Recommendations for maintenance testing, including instructions for pipe-to-reference cell potential measurements and frequency of testing.
 - f. If changes have been made to the maintenance and operating manuals originally submitted, submit updated maintenance and operating manuals two weeks prior to the final inspection.
7. Certifications: Two weeks prior to final inspection, submit the following:
 - a. Certification by the manufacturer that the cathodic protection system conforms to the requirements of the drawings and specifications.
 - b. Certification by the Contractor that the Cathodic protection system has been properly installed and adjusted.

1.5 APPLICABLE PUBLICATIONS

- A. The publications listed below form a part of this specification to the extent referenced. The publications are referenced in the text by basic designation only.
- B. American Society for Testing and Materials (ASTM):
 - B8-11..... Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
 - B843-13..... Magnesium Alloy Anodes for Cathodic Protection
 - D1248-12..... Polyethylene Plastic Extrusion Materials for Wire and Cable
 - F1182-13..... Anodes, Sacrificial Zinc Alloy
 - G57-06..... Field Measurement of Soil Resistivity Using the Wenner Four-Electrode Method
- C. American Society of Mechanical Engineers (ASME):

 - SP0169-2013..... Metallic Piping Systems

PART 2 - PRODUCTS

2.1 ANODES

A. Type: Type II, factory-packed in cloth bag or box containing prepared backfill mixture, with lead wires.

B. Construction:

1. Alloy Specifications:

Element	Percent of Weight
Aluminum	0.010 Max.
Manganese	0.50 - 1.30
Zinc	0.05 Max.
Silicon	0.50 Max.
Copper	0.02 Max.
Nickel	0.001 Max.
Iron	0.03 Max.
Other	0.30 Max.
Magnesium	Remainder

2. Core: Galvanized steel.

3. Lead Wire: Factory installed, No. 12 solid copper, 3 M (10 feet) long, with TW or THWN insulation.

4. Lead Wire Attachment to Core: Silver solder the lead wire to the anode core, and seal the connection with an epoxy sealing compound. Dielectric material shall extend past the connection and cover the lead wire insulation by not less than 12 mm (1/2 inch).

5. Packaging: Permeable cloth bag or box with backfill mixture completely surrounding anode 12 mm (1/2 inch) minimum.

a. Components:

Hydrated Gypsum	75 percent
Powdered Bentonite	20 percent
Anhydrous Sodium Sulphate	5 percent

b. Center the anode in the firmly packed backfill using spacers.

2.2 INSULATED CABLE

A. Single conductor, stranded, annealed copper, Type HMWPE (high molecular weight polyethylene) insulation.

B. Construction:

1. Thickness of insulation:

AWG-SIZE	mm (inches)
No. 8	2.8 (7/64)
No. 6	2.8 (7/64)
No. 4	2.8 (7/64)
No. 2	2.8 (7/64)
No. 1	3.2 (8/64)
No. 1/0	3.2 (8/64)

2. Insulation: ASTM D1248, Type 1, Class C, Category 5, Grade E5.

3. Conductors: ASTM B8.

C. Lead wires terminating at a junction box or test station shall have a cable identification tag.

2.3 CABLE CONNECTIONS

A. Connections between cables and tank, pipes, casings, or structures shall be exothermic welding process. Connections between cables and between cables and leads shall be corrosion-resistant split bolts.

B. Insulation of Cable-to-Cable Connections: Epoxy-resin splice kits with two-part resin, mold, sealing mastic.

C. Coating of Cable Connections to Protected Structures: Field-applied coating similar to that on the protected structure.

2.4 CABLE AND WIRE IDENTIFICATION TAGS

A. Stainless steel material with engraved letters. Print letters and numbers a minimum of 5 mm (3/16 inch) in size. Provide identifier legend in accordance with the drawings.

2.5 TEST STATIONS

A. Type: Weatherproof, located at grade, or aboveground if so shown on the drawings. Enclosed terminals for anode leads, test leads, leads attached to protected system, and connection points for test instruments

B. Construction:

1. Housing: The unit shall be of standard design, manufactured for use as a cathodic protection test station, complete with locking cover, terminal board, shunts, and brass or stainless steel hardware.

2. Provide terminal boards for anode junction boxes, bonding boxes, and test stations made of phenolic plastic. Insulated terminal boards shall have the required number of terminals (one terminal required for each conductor). Install solderless copper lugs and copper bus bars, shunts, and variable resistors on the terminal board as indicated. Test station terminal connections shall be permanently tagged to identify each termination of conductors (e.g. identify the conductors connected to the protected structure, anodes, and reference electrodes). Conductors shall be permanently identified by means of tags to indicate termination. Each conductor shall be color coded as follows:

Anode lead wire - black

Structure lead wire – white

Reference electrode lead wire - red

2.6 PERMANENT REFERENCE ELECTRODES

A. Permanent reference electrodes shall be zinc specifically manufactured for underground use, 10 inch diameter, by 24 inches long, plastic tube with an ion trap to minimize contamination of the cell. The cell shall be prepackaged by the manufacturer with a backfill material as recommended by the manufacturer. Provide cells with No. 14 HMWPE cable of sufficient length to extend to the test station without splicing. Reference electrodes shall have a minimum 15 year life, and stability of plus or minus 5 millivolts under 3 microampere load.

2.7 DIELECTRIC TAPE

A. Vinyl plastic electrical tape, 0.18 to 0.25 mm (7 - 10 mils) thick, pressure-sensitive adhesive.

2.8 WARNING TAPE

- A. 50 mm (2 inches) wide, detectable with metal detector, mylar-encased aluminum, orange color, imprinted "Cathodic Protection Cable Below" or similar.

2.9 DIELECTRIC INSULATION

- A. Rubber-based, 13 mm (0.5 inch) thick.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Anodes:
1. Excavate hole to a minimum 3 inches larger than the packaged anode diameter, and a minimum of two feet deep. Install in native soil, 3 feet minimum from protected structure, below centerline of protected structure, and at locations shown. Backfill shall be native soil. Install anodes adjacent to fuel tanks vertically.
 2. Do not lift or support anode by the lead wire. Where applicable, remove manufacturer's plastic wrap/bag from the anode. Exercise care to preclude damaging the cloth bag and the lead wire insulation.
 3. Center the packaged anode in the hole with native soil in layers not exceeding 150 mm (6 inches). Hand tamp each layer to remove voids taking care not to strike the anode lead wire. When the backfill is 6 inches above the top of the anode, pour not less than ten gallons of water into the hole to saturate the anode backfill and surrounding soil. Anodes shall not be backfilled prior to inspection and approval by the IOR or Corrosion Specialist.
- B. Cables and Anode Leads:
1. Burial: 2 feet minimum below finished grade, 6 inches minimum separation from other underground structures, backfill material in contact with cable free of rocks and debris. Cover the lead wire trench bottom with a 3 inch layer of sand or stone free earth. Center wire on the backfill layer, do not stretch or kink the conductor. Place backfill over wire in layers not exceeding 6 inches deep, and compact each layer thoroughly. Do not place tree roots, wood scrap, vegetable matter and refuse in backfill. Place cable warning tape within 18 inches of finished grade, above cable and conduit.
 2. Continuity Bonds: Use cable to connect adjacent protected structures, and protected structures separated by non-welded connectors. Provide 25 percent additional length as slack to allow differential movement of protected systems.
 3. Connections: Provide clean, bright, bare metal surface at all connection points. Connect anode lead wire(s) to the test station terminal board(s) by use of exothermic welds. Clean the structure surface by scraping, filing or wire brushing to produce a clean, bright surface. Weld connections using exothermic kit(s) in accordance with the kit manufacturer's instructions. Check and verify adherence of the bond to the substrate for mechanical integrity by striking the weld with a 2 pound hammer. Cover connections with an electrically insulating coating which is compatible with the existing coating on the structure. Allow sufficient slack in the lead wire to compensate for movement during backfilling operation.
 4. Warning Tape: Install 6 inches below grade, directly above cables.
- C. Test Stations: Provide test stations and permanent reference electrodes as follows:
1. At all above-ground water, fire water and natural gas appurtenances.
 2. At all insulating joints.
 3. At both ends of casings.
 4. Where the pipe crosses any other pipes.
 5. Where the pipe connects to an existing piping system.
 6. Where the pipe connects to a dissimilar metal pipe.
 7. Anchor terminal board firmly 2 feet minimum above grade for above grade units. Connect all anodes and protected structure to the test stations.
- D. Anchor terminal board firmly 2 feet minimum above grade for above grade units. Connect all anodes and protected structure to the test stations.

- E. Dielectric Insulation:
 - 1. General: Provide complete dielectric insulation between protected and unprotected systems and between protected systems and structures which could ground the cathodic protection. Required insulation points include all pipe entrances to buildings, manholes, and pits.
 - 2. Flanges: Install in locations open to view after completion of construction. Provide insulating gaskets, insulating sleeves on all bolts, insulating washers under bolt heads and nuts.
 - 3. Unions: Install in locations open to view after completion of construction. Unions not permitted in pipe sizes over 2 inches.
 - 4. Wall Penetration Seals: Install in space between pipes and wall sleeves at building and manhole walls.
 - 5. Coatings: Completely coat all pipe or conduit areas that are in contact with concrete.

- F. Permanent Reference Electrode Calibration and Installation:
 - 1. Provide zinc reference electrode(s) as indicated on the drawings.
 - 2. Prior to installation, soak the prepackaged reference electrode in a container of potable water for 30 minutes.
 - 3. Calibrate the permanent reference electrode in the presence of the IOR or Corrosion Specialist measuring the potential difference between the permanent reference electrode and an independent (portable) calibrated reference electrode placed in the water adjacent to the permanent reference electrode. Potential differences between the two electrodes of the same generic type should not exceed 15 millivolts when the sensing windows of the two electrodes being compared are not more than 2 mm (1/16 inch) apart but not touching. Zinc permanent reference electrodes should be within the range of 1000 to 1150 millivolts when calibrated with an independent (portable) calibrated copper-copper sulfate reference electrode with the two electrodes being not more than 2 mm (1/16 inch) apart but not touching. Permanent reference electrodes not within these potential differences shall be removed and replaced at the Contractor's expense. Prior to completely backfilling over reference electrodes, again verify the accuracy of the reference electrode. The testing provision shall also apply to replacement reference electrodes as well

3.2 RECONDITIONING OF SURFACES

- A. Restoration of disturbed surfaces in kind, or as shown in the contract documents.

3.3 FIELD QUALITY CONTROL

- A. Provide system with a calculated design life exceeding 40 years.

- B. Pre-construction Survey: The Corrosion Specialist shall perform a soil resistivity survey using the Wenner Four-Pin Method as described in ASTM G57. Survey entire length of proposed protected system at the structure depth. Also survey native-state structure-to-soil potential, soil pH, and presence of stray currents.

- C. Calculations: The Corrosion Specialist shall perform engineering calculations to verify the design of the system shown. Inform the Government of any recommended changes in the system design shown.

- D. Field Inspections During Construction: The corrosion specialist shall inspect the work at least twice to ascertain that there is no grounding, short circuits, coating damage, and that installation is in accordance with requirements.

- E. Final Inspection:
 - 1. Performed by Corrosion Specialist; witnessed by IOR or District.
 - 2. Test Instruments:
 - a. Digital Volt-Ammeter with impedance of 7-10 mega-ohms/volt.
 - b. Saturated copper-copper sulfate reference electrode.
 - c. Other instruments as required.
 - 3. Procedures: Conform to NACE RP0169.
 - 4. Test Results Required for Acceptance:

- a. Potential of minus 0.85 volt between protected structure and reference electrode.
 - b. Minimum shift of minus 300 millivolts upon application of protective current. Voltage measured between protected structure and reference electrode.
 - c. Minimum shift of minus 100 millivolts upon interruption of protective current. Voltage measured between protected structure and reference electrode.
 - d. Amperage value sufficient that anode life 40 years can be calculated. Provide calculations.
5. Test Report: Submit a complete report to IOR OR District showing all test measurements, calculations, list of instruments used. All structure-to-electrolyte measurements, including initial potentials and anode outputs, shall be recorded on applicable forms. Identification of test locations, test station and anode test stations shall coordinate with the as-built drawings and be provided on system drawings included in the report. The contractor shall locate, correct, and report to the IOR OR DISTRICT any short circuits encountered during the checkout of the installed cathodic protection system.
 6. One Year Warranty Period Testing: The Contractor shall inspect, test, and adjust the cathodic protection system semi-annually for one year, 2 interim inspections total, to ensure its continued conformance with the criteria outlined below. The performance period for these tests shall commence upon the completion of all cathodic protection work, including changes required to correct deficiencies identified during initial testing, and preliminary acceptance of the cathodic protection system by the IOR OR Corrosion Specialist. Copies of the One Year Warranty Period Cathodic Protection System Field Test Report, including field data, and certified by the Contractor's corrosion engineer shall be submitted to the IOR OR District.

3.4 AS-BUILT DRAWINGS

- A. Provide the District with one set of as-built drawings in hard copy and CD Rom showing dimensioned locations of all anodes, cables, test stations, and anode weights. Provide identification of test stations and anodes keyed to test reports.

3.5 INSTRUCTION

- A. Furnish the services of a factory-trained technician for one 4-hour period to instruct personnel in the operation, maintenance, safety, and emergency procedures of the cathodic protection system on the date requested by the District. The instructions shall cover all items contained in the operation and maintenance manual.

END OF SECTION

SECTION 265100 - INTERIOR LIGHTING

PART 1 - GENERAL

1.1 DEFINITIONS

- A. CCT: Correlated color temperature.
- B. CRI: Color-rendering index.
- C. LED: Light-emitting diode.
- D. LER: Luminaire efficacy rating.
- E. Lumen: Measured output of lamp and luminaire, or both.
- F. Luminaire: Complete lighting fixture, including ballast housing if provided.
- G. L70: Point in time where light fixture lumen output is 70% of initial light output.
- H. McAdams Ellipses: Color consistency of LED's from chip to chip.

1.2 SUBMITTALS

- A. Refer to Sections 012500 "Substitution Procedures" and 013300 "Submittal Procedures."
- B. Product Data: For each type of lighting fixture, arranged in order of fixture designation as listed on the fixture schedule. Include data on features, accessories, finishes, and the following:
 - 1. Physical description of lighting fixture including dimensions.
 - 2. Emergency lighting units including battery and charger.
 - 3. Energy-efficiency data.
 - 4. Lamp data: rated life, lumen output, CCT, CRI and wattage.
 - 5. Life, output (lumens, CCT, and CRI), and energy-efficiency data for lamps.
- C. Photometric Data Submittals
 - 1. Photometric data and adjustment factors based on laboratory tests, complying with IESNA Lighting Measurements Testing & Calculation Guides, for the following lighting fixture types. The adjustment factors shall be for lamps, ballasts, and accessories identical to those indicated for the lighting fixture as applied in this Project.
 - a. Testing Agency Certified Data: For indicated fixtures, photometric data shall be certified by a qualified independent testing agency. Photometric data for remaining fixtures shall be certified by manufacturer.
 - b. Manufacturer Certified Data: Photometric data shall be certified by a manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.
 - 2. Include the following in the photometric report:
 - a. List the measured candela values of the photometric distribution in at least three planes, except in the case of an axially symmetrical lighting fixture. Candela curves, lux (footcandle) and lumen tables, and iso-lux (iso-footcandle) contours are not acceptable.
 - b. List the type of lamps, ballasts, and lighting control devices, such as lenses and louvers, used with the tested lighting fixture.
- D. Shop Drawings: For nonstandard or custom lighting fixtures as indicated on the fixture schedule. Include plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 2. Wiring Diagrams: For power, signal, and control wiring.
- E. Installation instructions.
- F. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
1. Lighting fixtures.
 2. Ceiling-mounted projectors.
 3. Structural members to which suspension systems for lighting fixtures will be attached.
 4. Other items in finished ceiling including the following:
 - a. Air outlets and inlets.
 - b. Speakers.
 - c. Sprinklers.
 - d. Smoke and fire detectors.
 - e. Occupancy sensors.
 - f. Access panels.
- G. Qualification Data: For qualified agencies providing photometric data for lighting fixtures.
- H. Product Certificates: Compatibility for each type of ballast for bi-level and dimmer-controlled lamps and fixtures as specified, from manufacturer.
- I. Field quality-control reports.
- J. Operation and Maintenance Data: For lighting equipment and fixtures to include in emergency, operation, and maintenance manuals.
1. Provide a list of all lamp types used on Project; use ANSI and manufacturers' codes.
- K. Warranty: Sample of special warranty.

1.3 QUALITY ASSURANCE

- A. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by manufacturers' laboratories that are accredited under the National Volunteer Laboratory Accreditation Program for Energy Efficient Lighting Products.
- B. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910, complying with the IESNA Lighting Measurements Testing & Calculation Guides.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- D. Comply with NFPA 70.
- E. Provide fixtures U.L. listed and labeled for the application.
- F. FM Global Compliance: Lighting fixtures for hazardous locations shall be listed and labeled for indicated class and division of hazard by FM Global.

1.4 COORDINATION

- A. Coordinate layout and installation of lighting fixtures and suspension system with other construction that penetrates ceilings or is supported by them, including HVAC equipment, fire-suppression system, and partition assemblies.

1.5 ALLOWANCES

- A. Extra Fixtures
 - 1. Provide an additional **5** exit signs, Type "**X**" above what is indicated on the drawings. Include for each of the extra units, installation of 75 feet of conduit and wire, and connection to the emergency system.
 - 2. Install devices at locations to be determined by the Architect.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide product by manufacturers indicated on Drawings and specified.

2.2 GENERAL REQUIREMENTS FOR LIGHTING FIXTURES AND COMPONENTS

- A. Recessed Fixtures: Comply with NEMA LE 4 for ceiling compatibility for recessed fixtures.
- B. LED Fixtures: Minimum rated lifetime of L70 at 50,000 hours based on IES LM-79 testing; passive thermal management only unless otherwise indicated.
- C. Metal Parts: Free of burrs and sharp corners and edges.
- D. Sheet Metal Components: Steel unless otherwise indicated. Form and support to prevent warping and sagging.
- E. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit re-lamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during re-lamping and when secured in operating position.
- F. Diffusers and Globes:
 - 1. Acrylic Lighting Diffusers: 100 percent virgin acrylic plastic. High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
 - a. Lens Thickness: At least 0.125 inch minimum unless otherwise indicated.
 - b. Distribution: **Pattern 12**
 - c. UV stabilized.
 - 2. Glass: Annealed crystal glass unless otherwise indicated.
- G. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps and ballasts. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.
 - 1. Label shall include the following lamp and ballast characteristics:
 - a. "USE ONLY" and include specific lamp type.

- b. Lamp diameter code (T-4, T-5, T-8, T-12, etc.), tube configuration (twin, quad, triple, etc.), base type, and nominal wattage for fluorescent and compact fluorescent luminaires.
- c. Lamp type, wattage, bulb type (ED17, BD56, etc.) and coating (clear or coated) for HID luminaires.
- d. Start type (preheat, rapid start, instant start, etc.) for fluorescent and compact fluorescent luminaires.
- e. ANSI ballast type (M98, M57, etc.) for HID luminaires.

- H. Electromagnetic-Interference Filters: Factory installed to suppress conducted electromagnetic interference as required by MIL-STD-461E. Fabricate lighting fixtures with one filter on each ballast indicated to require a filter.

2.3 LED MODULES/BOARDS

- A. Minimum rated lifetime of L70 at 50,000 hours based on IES LM-80 testing; 4-step McAdams Ellipse maximum color consistency unless otherwise indicated; 80 CRI minimum unless otherwise indicated.

2.4 EXIT SIGNS

- A. General Requirements for Exit Signs: Comply with UL 924; for sign colors, visibility, luminance, and lettering size, comply with authorities having jurisdiction.
- B. Internally Lighted Signs:
 - 1. Lamps for AC Operation: LEDs, 50,000 hours minimum rated lamp life.
- C. Self-Powered Exit Signs (Battery Type): Integral automatic charger in a self-contained power pack.
 - 1. Battery: Sealed, maintenance-free, nickel-cadmium type.
 - 2. Charger: Fully automatic, solid-state type with sealed transfer relay.
 - 3. Operation: Relay automatically energizes lamp from battery when circuit voltage drops to 80 percent of nominal voltage or below. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
 - 4. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
 - 5. LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.
 - 6. Remote Test: Switch in hand-held remote device aimed in direction of tested unit initiates coded infrared signal. Signal reception by factory-installed infrared receiver in tested unit triggers simulation of loss of its normal power supply, providing visual confirmation of either proper or failed emergency response.
 - 7. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and a flashing red LED.

2.5 EMERGENCY LIGHTING UNITS

- A. General Requirements for Emergency Lighting Units: Self-contained units complying with UL 924.
 - 1. Battery: Sealed, maintenance-free, lead-acid type.
 - 2. Charger: Fully automatic, solid-state type with sealed transfer relay.
 - 3. Operation: Relay automatically turns lamp on when power-supply circuit voltage drops to 80 percent of nominal voltage or below. Lamp automatically disconnects from battery when voltage approaches deep-discharge level. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
 - 4. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
 - 5. LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.

6. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and a flashing red LED.

2.6 LIGHTING FIXTURE SUPPORT COMPONENTS

- A. Comply with Division 26 Section "Hangers and Supports for Electrical Systems" for channel- and angle-iron supports and nonmetallic channel and angle supports.
- B. Single-Stem Hangers: 1/2-inch steel tubing with swivel ball fittings and ceiling canopy. Finish same as fixture.
- C. Twin-Stem Hangers: Two, 1/2-inch steel tubes with single canopy designed to mount a single fixture. Finish same as fixture.
- D. Wires: ASTM A 641/A 641M, Class 3, soft temper, zinc-coated steel, 12 gage.
- E. Rod Hangers: 3/16-inch minimum diameter, cadmium-plated, threaded steel rod.
- F. Hook Hangers: Integrated assembly matched to fixture and line voltage and equipped with threaded attachment, cord, and locking-type plug.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General
 1. Install lighting systems in accordance with NECA/IESNA 500, 501 and 502.
 2. Assemble and install lighting fixtures in a manner to insure a straight and true installation without dents, warps, and other irregularities.
 3. Where lighting fixtures are specified or indicated for installation in continuous rows, install fixtures in a continuous end-to-end manner without gaps between fixture segments, and with vertical and horizontal variations, along the length of the continuous installation, no greater than 6 mm (1/4 inch).
 4. Coordinate the lighting system installation with relevant trades so as to eliminate installation interferences, such as with hangers, mechanical ducts, sprinklers, piping and steel structure.
 5. Provide plaster frames for recessed fixtures installed in other than suspended grid ceiling systems.
- B. Lighting fixtures:
 1. Set level, plumb, and square with ceilings and walls unless otherwise indicated.
 2. Install lamps in each luminaire.
- C. Temporary Lighting: If it is necessary, and approved by Architect, to use permanent luminaires for temporary lighting, install and energize the minimum number of luminaires necessary. When construction is sufficiently complete, remove the temporary luminaires, disassemble, clean thoroughly, install new lamps, and reinstall.
- D. Lay-in Ceiling Lighting Fixtures Supports: Use grid as a support element.
 1. Install ceiling support system rods or wires for each fixture, independent of the ceiling suspension devices. Locate not more than 6 inches from lighting fixture corners.
 2. Support Clips: Fasten to lighting fixtures and to ceiling grid members at or near each fixture corner with clips that are UL listed for the application.
 3. Fixtures of Sizes Less Than Ceiling Grid: Install as indicated on reflected ceiling plans or center in acoustical panel, and support fixtures independently with at least two 3/4-inch metal channels spanning and secured to ceiling tees.

4. Install at least one independent support rod or wire from structure to a tab on lighting fixture. Wire or rod shall have breaking strength of the weight of fixture at a safety factor of 3.

E. Suspended Lighting Fixture Support:

1. Pendants and Rods: Where longer than 48 inches, brace to limit swinging.
2. Stem-Mounted, Single-Unit Fixtures: Suspend with twin-stem hangers.
3. Continuous Rows: Use tubing or stem for wiring at one point and tubing or rod for suspension for each unit length of fixture chassis, including one at each end.
4. Do not use grid as support for pendant luminaires. Connect support wires or rods to building structure.
5. Install suspended lighting fixtures at mounting heights specified or indicated, plus or minus 6 mm (1/4-inch).

F. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.2 IDENTIFICATION

- A. Install labels with panel and circuit numbers on concealed junction and outlet boxes. Comply with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."

3.3 FIELD QUALITY CONTROL

- A. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery and retransfer to normal.
- B. Verify that self-luminous exit signs are installed according to their listing and the requirements in NFPA 101.
- C. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

3.4 CLEANING

- A. Clean interior surfaces of lighting fixtures of dirt and construction debris upon completion of installation. Clean fingerprints, smudges, and other marks from lenses, louvers, and reflecting surfaces. Leave free of visible marks.

3.5 STARTUP SERVICE

- A. Burn-in all lamps that require specific aging period to operate properly, prior to occupancy by Owner. Burn-in fluorescent and compact fluorescent lamps intended to be dimmed, for at least 100 hours at full voltage.

3.6 ADJUSTING

- A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting aimable luminaires to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose. Some of this work may be required after dark.

1. Adjust the lamp socket position in downlight lighting fixtures per the manufacturer's recommendations for the specified lamp type and voltage. Optimize the lighting output of the lighting fixture by properly locating the light center within the reflector.
2. Upon final completion of the installation of the lighting fixtures and any associated lighting control systems, notify the Architect in writing to arrange for the final adjustment and aiming of lighting equipment requiring aiming and adjustment.
3. Adjust aimable luminaires in the presence of Architect and Lighting Designer.

END OF SECTION

SECTION 265600 - EXTERIOR LIGHTING

PART 1 - GENERAL

1.1 ACTION SUBMITTALS

- A. Product Data: For each luminaire, pole, and support component, arranged in order of lighting unit designation. Include data on features, accessories, and finishes.
1. Lamps, including life, output (lumens, CCT, and CRI) and energy-efficiency data.
 2. Photometric data and adjustment factors based on laboratory tests, complying with [IES LM-79][IES LM-80]
 - a. Manufacturer's Certified Data: Photometric data certified by manufacturer's laboratory with a current accreditation under the NVLAP for Energy Efficiency Lighting Products.
 - b. Testing Agency Certified Data: For indicated luminaires, photometric data certified by a qualified independent testing agency. Photometric data for remaining luminaires shall be certified by manufacturer.
 3. Wiring diagrams for power, control, and signal wiring.
 4. Means of attaching luminaires to supports and indication that the attachment is suitable for components involved.
- B. Shop Drawings:
1. For nonstandard or custom luminaires.
 - a. Include plans, elevations, sections, and mounting and attachment details.
 - b. Include details of luminaire assemblies. Include dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - c. Include diagrams for power, signal, and control wiring.
 2. Anchor-bolt templates keyed to specific poles and certified by manufacturer.

1.2 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Glass, Acrylic, and Plastic Lenses, Covers, and Other Optical Parts: One for every 100 of each type and rating installed. Furnish at least one of each type.
 2. Diffusers and Lenses: One for every 100 of each type and rating installed. Furnish at least one of each type.
 3. Globes and Guards: One for every 20 of each type and rating installed. Furnish at least one of each type.

1.3 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NFPA 70.
- C. Provide luminaires from a single manufacturer for each luminaire type.
- D. Each luminaire type shall be binned within a three-step MacAdam Ellipse to ensure color consistency among luminaires.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Protect finishes of exposed surfaces by applying a strippable, temporary protective cover prior to shipping.

1.5 FIELD CONDITIONS

- A. Verify existing and proposed utility structures prior to the start of work associated with luminaire installation.
- B. Mark locations of exterior luminaires for approval by Architect prior to the start of the luminaire installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide product indicated on Drawings.

2.2 GENERAL REQUIREMENTS FOR LUMINAIRES

- A. Luminaires shall comply with UL 1598 and be listed and labeled for installation in wet locations by an NRTL acceptable to authorities having jurisdiction.
- B. Lateral Light Distribution Patterns: Comply with IESNA RP-8 for parameters of lateral light distribution patterns indicated for luminaires.
- C. Metal Parts: Free of burrs and sharp corners and edges.
- D. Sheet Metal Components: Corrosion-resistant aluminum unless otherwise indicated. Form and support to prevent warping and sagging.
- E. Housings: Rigidly formed, weather- and light-tight enclosures that will not warp, sag, or deform in use. Provide filter/breather for enclosed luminaires.
- F. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses. Designed to disconnect ballast when door opens.
- G. Exposed Hardware Material: Stainless steel.
- H. Internal driver.
- I. Lamps dimmable from 100 percent to 0 percent of maximum light output.
- J. L70 lamp life of 50,000 hours.
- K. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
- L. Light Shields: Metal baffles, factory installed and field adjustable, arranged to block light distribution to indicated portion of normally illuminated area or field.
- M. Reflecting surfaces shall have minimum reflectance as follows unless otherwise indicated:

1. White Surfaces: 85 percent.
 2. Specular Surfaces: 83 percent.
 3. Diffusing Specular Surfaces: 75 percent.
- N. Lenses and Refractors Gaskets: Use heat- and aging-resistant resilient gaskets to seal and cushion lenses and refractors in luminaire doors.
- O. Luminaire Finish: Manufacturer's standard paint applied to factory-assembled and -tested luminaire before shipping. Where indicated, match finish process and color of pole or support materials.

PART 3 - EXECUTION

3.1 LUMINAIRE INSTALLATION

- A. Install lamps in each luminaire.
- B. Fasten luminaire to indicated structural supports.
1. Use fastening methods and materials selected to resist seismic forces defined for the application and approved by manufacturer.
- C. Adjust luminaires that require field adjustment or aiming.[Include adjustment of photoelectric device to prevent false operation of relay by artificial light sources, favoring a north orientation.]

3.2 CORROSION PREVENTION

- A. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum by insulating fittings or treatment.
- B. Steel Conduits: Comply with Section 260533 "Raceways and Boxes for Electrical Systems." In concrete foundations, wrap conduit with 0.010-inch- thick, pipe-wrapping plastic tape applied with a 50 percent overlap.

3.3 GROUNDING

- A. Ground metal poles and support structures according to Section 260526 "Grounding and Bonding for Electrical Systems."
1. Install grounding electrode for each pole unless otherwise indicated.
 2. Install grounding conductor pigtail in the base for connecting luminaire to grounding system.
- B. Ground nonmetallic poles and support structures according to Section 260526 "Grounding and Bonding for Electrical Systems."
1. Install grounding electrode for each pole.
 2. Install grounding conductor and conductor protector.
 3. Ground metallic components of pole accessories and foundations.

3.4 ADJUSTING

- A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting aimable luminaires to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose. Some of this work may be required after dark.
1. Adjust the lamp socket position in downlight lighting fixtures per the manufacturer's recommendations for the specified lamp type and voltage. Optimize the lighting output of the lighting fixture by properly locating the light center within the reflector.

2. Upon final completion of the installation of the lighting fixtures and any associated lighting control systems, notify the Architect in writing to arrange for the final adjustment and aiming of lighting equipment requiring aiming and adjustment.
3. Adjust aimable luminaires in the presence of Architect and Lighting Designer.

END OF SECTION 265600

SECTION 27 0000 - COMMUNICATIONS

PART 1 - GENERAL

1.1 SUMMARY

- A. This section includes general information that applies to all Division 27 specifications.
- B. Related Sections:
 - 1. 270820: Copper Testing
 - 2. 271500: Communications Horizontal Cabling
 - 3. 271600: Communications Connecting Cords Devices & Adapters

- T. As Necessary: That work which is required for completed construction, but is not necessarily shown or described in the Contract Documents.
- U. As Required: That work which is required for completed construction and is shown on the drawings or described in the project Specification.
- V. Cabling: Cable assembly, raceway, conductors, fittings and any other necessary accessories to make a complete wiring system.
- W. Backbone: A facility (e.g., pathway, cable or conductors) between telecommunications rooms, or floor distribution terminals, the entrance facilities and equipment rooms within or between buildings.
- X. Backbone Cabling: Cabling and connecting hardware that provides interconnections between telecommunications rooms, equipment rooms, and entrance facilities.
- Y. BICSI: Building Industry Consulting Service International.
- Z. Concealed: Hidden from sight, buried as in chases, furred spaces, shafts, fixed ceiling or embedded in construction.
- AA. Contractor: The installation Contractor responsible for the furnishing and installation of all work indicated within this Specification.
- BB. Construction Manager: The Owner's appointed representative.
- CC. Equipment Outlet (EO): A device also known as the outlet or information outlet placed at the user workstation for termination using connectors (jacks) of horizontal media for connectivity of data and voice at teacher work area outlet, multimedia equipment. These outlets provide the connection point to voice, data, and other media services.
- DD. Exposed: Bare, open to the elements, out in the open, uncovered.
- EE. Furnish: Purchase, supply, provide and deliver to the project site, protect and provide interim storage and be ready for unloading, unpacking, assembly, installation, and similar operations in accordance with Manufacturer's specifications."
- FF. GE Grounding equalizer: Employed in a multistory building to interconnect multiple TBBs on the same floor. Sized equal to TBB.

DISTRICT ITS
REQUESTED
REMOVAL DUE
TO DUPLICATION

- GG. Horizontal Cabling: Cabling between and including the work area outlet/connector and the horizontal cross-connect/patch cord in the telecommunications room.
- HH. Install: Describes operations at project site including the actual "unloading, unpacking, rigging in place, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protecting, cleaning, and similar operations".
- II. Installer: Contractor, Subcontractor and/or supplier who uses their own employees for performance of all construction activity related to their specified responsibilities, including installation, erection, application, and similar operations. Installers are required to be experienced in the operations they are engaged to perform and the "Installers" must be an authorized Manufacturers representative, certified, experienced and qualified to provide, install, program, troubleshoot, train, warrant and service all the systems in this section in their entirety.
- JJ. If Applicable: That work which may be required for completed construction at applicable locations, but is not necessarily shown or described in the Contract Documents.
- KK. Owner: Person or entity for which the building and construction is being done; and/or that will take possession of the property once the construction is complete.
- LL. Owner Representative: The person or entity representing the Owner on contractual matters.
- MM. Product: Any item of equipment, material, fixture, apparatus, appliance or accessory installed under this Division.
- NN. Provide: To "furnish and install, complete and ready for the intended use".
- OO. RCDD: Registered Communications Distribution Designer (RCDD).
- PP. Substantial Completion: The project is sufficiently complete to be utilized for its intended use as stated in the body of this written Specification.
- QQ. TBB: Telecommunications Bonding Backbone
- RR. TGB: Telecommunications Grounding Busbar
- SS. TMGB: Telecommunications Main Grounding Busbar
- TT. Words in the singular: Will also mean and include the plural, wherever the context so indicates, and words in the plural will mean the singular, wherever the context so indicates.

1.4 SUBMITTAL REQUIREMENTS

- A. General
 - 1. Provide required submittals in accordance with Conditions of the Contract, and Division 1 Submittal Procedures Section.
 - 2. Format:
 - a. For this section furnish submittal data neatly bound in an 8 1/2" x 11" folder or binder for each specification section with a table of contents listing materials by Section and paragraph number.
 - b. Project name and address
 - c. Number of submittal
 - d. Name and address of the contractor
 - e. Date of submittal
 - f. Table of contents with material page numbers listed

- g. Page number of the corresponding specification or drawing numbers in the contract documents.
3. Submittals to consist of:
 - a. Detailed shop drawings,
 - b. Product specifications,
 - c. Block wiring diagrams,
 - d. "Catalog cuts" and data sheets containing physical and dimensional information,
 - e. Performance data,
 - f. Electrical characteristics
 - g. Materials used in fabrication, and material finish.
4. Clearly indicate by arrows or brackets precisely what is being submitted on and those optional accessories which are included and those which are excluded.

B. Material submittals

1. Label each submittal with the Specification Section Number and provide a cover letter or stamp stating that the submittal has been thoroughly reviewed by the Contractor and complies with the requirements of the Contract Documents. Failure to comply with this requirement will constitute grounds for rejection of data.
2. For each product, indicate where it is intended to be installed.
3. Resubmittals: Provide a cover letter with the resubmittal that lists the action taken and revisions made to each product submittal in response to Submittal Review Comments, *indicating the page in the resubmittal that the new information occurs*. Failure to include this cover letter will constitute rejection of the resubmittal package and no review will occur.

C. Under the provisions of this request for proposal, prior to the start of work the Structured Cabling System Contractor will:

1. Submit copies of the certification of the company and names of staff that will be performing the installation and termination of the installation to provide proof of compliance of this spec.
2. Submit proof from Manufacturer of Contractor's good standing in Manufacturer's program where contractor is authorized by manufacturer to do warranted work.
3. Submit appropriate cut sheets and samples for all products, hardware and cabling.
4. Work will not proceed without the Owner's approval of the submitted items.
5. The Structured Cabling Systems Contractor will submit in writing any material substitutions they propose and receive approval from the Owners on all substitutions of material in writing prior to purchase and installation. No substituted materials will be installed except by written approval from the Owner.
6. Refer to other applicable sections for additional submittals requirements.

Why does this need to be deleted?

D. Provide Indexed Project Manual composed of Test Results, As-Built drawings, material cut sheets, maintenance instructions, Parts List (with part numbers) of all materials installed, etc., at the completion of project.

E. Final close out documents including but not limited to bound indexed test results, project manual that includes such items as manufacturer and contractor warranties, product cut sheets, material submittals, etc.

1. Provide Building Structured Cabling Systems Administration Report indicating TIA/EIA-606 required information.
2. Hard copy documentation of test results for every cable segment and link in 3- ring binder. Documents will include measured values as well as whether or not the test passed.
3. Provide "As-Built" Drawings on AutoCAD Version the same as provided by architect to the Owner. Obtain copy of original Drawings from the Architect.
 - a. "As-Built" drawings indicating location of all equipment including but not limited to work area outlets, patch panels, cross connect blocks, on each segment and cable routing outlet and identifiers. Indicate labeling for each piece of equipment.

- b. Provide respective copies mounted in each telecommunications room, and the main cross connect.
 - c. As-Built drawings will contain all installed cabling and materials. Outlets will be numbered with each cable associated with the work area outlet.
4. Place a laminated ½ or full-size floor plan of these drawing (coordinate with Owner) on the wall of each communications room.

1.5 QUALITY ASSURANCE

- A. The Telecommunications Subcontractor shall have total responsibility for the coordination and installation of the work shown and described in the telecommunications drawings and specifications. The Telecommunications Subcontractor shall be a company specializing in the design, fabrication and installation of integrated telecommunications systems.
- B. Telecommunications Systems specified shall be engineered, assembled and installed under the direction of a pre-qualified Telecommunications Subcontractor. Pre-qualification requirements shall include submittal by the Telecommunications Subcontractor to the Architect of the following:
 1. List of previous projects of this scope and nature, including names and sizes of projects (to include square footage and construction cost – overall and that of the Telecommunications Subcontractor), description of work, times of completion, and names of contact persons for reference.
 2. Installers shall certify that they are manufacturer-authorized or trained for work to be performed.
- C. The Installer (Firm and Employees) will be experienced in the operations they are engaged to perform. Demonstrate at least five years of continuous recent experience on similar projects. The Installer will hold recent, up-to-date licenses, certifications and training certificates in the area the project is located and for the equipment to be installed.
- D. The Telecom contractor shall be a CommScope Authorized Partner whose work, upon completion, will result in the provision of CommScope Network Infrastructure System 25 Year Extended Product and Application Warranty for the TeraSPEED fiber and SYSTIMAX Category 6A UTP infrastructure. CommScope will provide a numbered, registered System Warranty Certificate.
- E. Provide names of contacts from the last five similar projects including the General Contractor, Owner's Representative, Architect and Engineer. Indicate project locations, scope and current phone numbers that the contacts can be reached at.
- F. Qualified Structured Cabling System Installation firms will have demonstrable design and installation training with certifications of competence. Certified training will be industry recognized and at least equal to:
 1. Building Industry Consulting Service International, Inc. (BISCI) Registered Installer.
 2. Registered Communications Distribution Designer (RCDD).
 3. Manufacturer Certified Installer
- G. Provide a full time on site foreman who personally has been certified as described above. Submit all documentation under this Section.
- H. Provide an on-call Project Manager to supervise the project.
- I. Each Foreman and Installer working on this project will be trained to the qualified level as specified by the Manufacturer(s) for installation and maintenance of equipment being provided on this project. The training will consist of at least a minimum of proper installation techniques of their specific equipment in order to have a complete operating system meeting or exceeding the requirements as specified herein. Each Foreman and Installer working on this project will have

documentation from the Manufacturer indicating that they have been adequately trained prior to the start of the project. Only Foreman and Installers who have been properly trained and documented by the Manufacturer whose equipment is being provided on this project will be allowed to install.

- J. Separate Qualifications Requirements:
- K. Installers will be specifically qualified for each system being installed under this section. Provide documentation for each installer including:
 - 1. State of CA License as required
 - 2. Registered Telecommunications Installer Apprentice Certificate
- L. Maintain at the site an updated copy of the Manufacturer Trained Installers list including a copy of their training documentation from the Manufacturer. This documentation will be made available to the Architect upon request.

1.6 BIDDER QUALIFICATIONS

- A. Bidding Contractor shall be licensed to install telecommunications systems in the state where work will be performed.
- B. Bidding Contractor shall have a minimum of 5 years of experience installing structured cabling for telecommunications.
- C. Bidding Contractor shall have the capability to bond project in its entirety.
- D. Bidding Contractor shall be able to provide insurance at the request of the owner.

1.7 DELIVERY, STORAGE, AND PROTECTION

- A. Contractor shall ensure that materials delivery to work area shall be coordinated with construction site manager responsible for materials distribution to all trades.
- B. Contractor is responsible for all materials, tools and vehicles left on the job site.
- C. Contractor shall coordinate a disposal bin for the removal of all trash produced by the Contractor's associated personnel during the project.
- D. Contractor shall ensure materials are stored in an environmental area where:
 - 1. Temperature does not exceed 120 degrees Fahrenheit nor below 32 degrees Fahrenheit.
 - 2. Humidity does not exceed 80%.
 - 3. No direct exposure to sunlight.
- E. Cable shall be stored according to Manufacturer's recommendations as a minimum. In addition, cable must be stored in a location protected from vandalism and weather. If cable is stored outside, it must be covered with opaque plastic or canvas with provision for ventilation to prevent condensation and for protection from weather. If air temperature at cable storage location will be below 40 degrees F., the cable shall be moved to a heated (50 degrees F. minimum) location. If necessary, cable will be stored off site at the Contractor's expense.
- F. Deliver equipment in individual shipping splits for ease of handling, mount on shipping skids and wrap for protection.
- G. Inspect and report concealed damage to carrier within specified time.

- H. Store in a clean, dry space. Maintain factory protection or cover with heavy canvas or plastic to keep out dirt, water, construction debris, and traffic. Heat enclosures to prevent condensation. Meet the requirements and recommendations of NFPA 70B and the Manufacturer. Location will be protected to prevent moisture from entering enclosures and material.
- I. Handle in accordance with NEMA and the Manufacturer's recommendations and instructions to avoid damaging equipment, installed devices and finish.
- J. The equipment will be kept upright at all times. When equipment has to be tilted for ease of passage through restricted areas during transportation, the Manufacturer will be required to brace the equipment suitably to ensure that the tilting does not impair the functional integrity of the equipment.

1.8 PROJECT CONDITIONS

- A. Environmental Requirements
 - 1. Contractor shall ensure that any pollutants produced during the work are disposed of according to local, state or national regulations. Follow the most stringent guidelines.
 - 2. It is preferred that the Communications Contractor recycle any used or un-used components during the course of the construction project.
 - 3. Coordinate with LEED project manager if cabling system or components will be used for points in a LEED certified project.
- B. Existing conditions
 - 1. Prior to bid, Telecommunications Subcontractor is to visit the existing building and evaluate all existing conditions. Bring to the attention of the Owner and Design Team any cause for concern or apparent conflicts with the contract documents as soon as practically possible.
- C. Field Measurements
 - 1. Contractor shall coordinate with electrical engineer on project that the main electrical service ground has a resistance to earth of less than 5 ohms.
 - 2. Contractor shall ensure that all grounding buss bars for all equipment network rooms shall have a resistance of less than 1 ohm back to the main electrical service ground.
 - 3. Contractor shall ensure that all field testers have been calibrated from the Manufacturer within 1 year.
 - 4. Refer also to grounding specification 27 05 26

1.9 PRE-CONSTRUCTION MEETING

- A. Attend a pre-construction meeting with ITS and Designated ITS design team (Ryan Raskop, Salter). Telecommunications pre-construction meeting will be coordinated by CLPCCD ITS

1.10 SEQUENCING

- A. Contractor shall coordinate with Owner's project manager on sequencing of various trades and construction teams for the lifecycle of the project.
- B. Cooperation and coordination with other trades.
 - 1. The work will be so performed that the progress of the entire building construction, including all other trades, will not be delayed and not interfered with. Materials and apparatus will be installed as fast as conditions of the building will permit and must be installed promptly when and as directed.
 - 2. Keep fully informed as to the shape, size and position of all openings required for all apparatus and give information in advance to build openings into the work. Furnish and set in place all sleeves, pockets, supports and incidentals.

3. Coordinate exact locations and roughing in dimensions of all work before installation and make all final connections as required. Any changes required to avoid interferences or to provide adequate clearances for Code and maintenance requirements will be made at no additional costs.
4. Structural elements of the project will not be relocated, altered or changed to accommodate the work without written authorization from the Owner/Architect.
5. Work that is installed before coordination with other trades or that causes interference with the work of other trades will be changed to correct condition at no additional cost to the Owner.
6. Obtain a complete set of Project Drawings and Specifications for coordination and to determine the full scope of work.
7. Attend project coordination meetings to coordinate work of this Section, pathways, work of other trades phasing and other project requirements.

Why does this need to be deleted?

1.11 CONTINUITY OF SERVICE AND SCHEDULING OF WORK

- A. Refer to the overall scheduling of the work of the project. Schedule work, process Submittals and order materials and equipment to conform to this schedule and install work to not delay nor interfere with the progress of the project.
- B. Inform General Contractor and Architect immediately of any delays or potential delays. Furnish Manufacturer's letter to verify order date, equipment delays, expected shipment date, order number, and potential remedies to speed up delivery. Any costs to speed up delivery will be implemented at no cost to the project if the equipment or material was not ordered as soon as possible after Contract award or within the time frames indicated with the Submittals.
- C. Include premium time required to comply with the project scheduling and phasing.
- D. Be aware of, and plan for, project scheduling and phasing. Provide for complete continuous operation of all systems. Coordinate scheduling and phasing with the Architect, Owner, other Trades, and the General Contractor.

Why does this need to be deleted?

1.12 LABELING

- A. CLPCCD ITS will provide the labeling scheme to be used for the telecommunications cabling.
- B. Document in digital format a set of plans with all elements and their unique numbers. Paper copies are not allowed by the District.
- C. Provide a definition or labeling matrix with As-Built/Document Close-Out submittals that defines each labeling element with examples of each field defined. All documentation shall be in digital format. Paper copies are not allowed by the District.
- D. Submit in digital format complete labeling scheme for all elements with initial submittals for project.
- E. Ensure labeling for backbone cables includes information on the space name/number of the cable's opposite end. This requirement includes buss bar, bonding conductor, and bonding backbone cable labeling.
- F. As a part of the close-out submittal package, provide riser cable and bonding conductors drawings showing the cables, their installed routes, and the cable numbers. These documents will be in addition to the As-Built floor plan submittals that identify work area outlet placement with their respective identification numbers. All submittals shall be in digital format. Paper copies are not allowed by the District.

1.13 POST CONSTRUCTION

- A. Meeting: Subsequent to substantial completion and testing, call a meeting with GC, Owner's representative, design consultant, and others deemed necessary by Owner &/or GC.
 - 1. At the meeting, contractor shall present a DRAFT of AS-Built drawings, test results, and any other material contractor deems appropriate to completing the project for review by other attendees.
 - 2. Any comments or requests for correction shall be noted by the contractor during the meeting. Corrections to all documents shall be made and final copies shall be submitted within 1 week of meeting.
- B. Punch Walk: Arrange with Owner's project team, GC, and consultant a final punch-walk to review completed installation.
 - 1. Document all discussion, comments, and requests by Owner's team, noting outstanding items that must be ameliorated.
 - 2. Complete all tasks on punch-list.
- C. Notification of completion of work: Notify Owner in writing when installation is complete. Arrange for a site walk thru with the Owner demonstrate that all punch list items have been completed.
 - 1. Record any Owner comments on items that may have been left incomplete whether or not they were a part of punch list.
 - 2. Complete any outstanding items.
- D. Failure to complete installation
 - 1. If the contractor calls for a punch walk because the contractor states that the installation is complete, and it is found to be incomplete and/or systems are not functioning thus requiring the contractor to do more work to complete the job, any re-visits for further punch walks will be charged to the contractor at our going hourly rate.
- E. Provide "As-Built" documentation to the design team for review and implementation of Record Drawing documents.

1.14 PROTECTION OF WORK AND PROPERTY

- A. Be responsible for the care and protection of all work included under this Section until it has been tested and accepted.
- B. Protect all equipment and materials from damage from all causes including theft. All materials and equipment damaged or stolen will be replaced with equal material or equipment at the option of the Architect and Owner.
- C. Materials and equipment stored for this project will be protected and maintained according to the Manufacturer's recommendations and requirements and according to the applicable requirements of NFPA 70B.
- D. Protect all equipment, outlets and openings with temporary plugs, caps and covers. Protect work and materials of other trades from damage that might be caused by work or workmen and make good any damage caused.
- E. Use caution to avoid damage to existing work, and to prevent harm to personnel working in all areas.
- F. Observe all safety precautions and requirements for the construction.

- G. The General Contractor and the Installer are responsible for initiating, maintaining, and supervising all safety precautions and requirements during construction.
- H. Coordinate installations with all other trades in order to not damage equipment or cables during construction. Any work that is damaged during construction will not be repaired. Replace damaged work completely, with no splices in cabling, at no additional cost to the Owner.

PART 2 - PRODUCTS

- 2.1 REFER TO 27 05 26 FOR BONDING AND GROUNDING SPECIFICATIONS
- 2.2 REFER TO 27 11 00 FOR EQUIPMENT ROOM FITTINGS
- 2.3 REFER TO 27 15 00 FOR COMMUNICATIONS HORIZONTAL CABLING
- 2.4 REFER TO 27 16 00 FOR COMMUNICATIONS CONNECTING CORDS, DEVICES AND ADAPTERS
- 2.5 LABELING
 - A. Horizontal and grounding cabling: 1" white with black lettering. Dymo Rhino P/N 1734821
 - 1. Approved equal
 - B. Backbone cabling: 1" white nylon with black lettering: Dymo Rhino P/N 1734524
 - 1. Approved equal

2.6 CABLE SUPPORTS

- A. Provide 3/8" threaded rod for support of J-Hooks when conduit not utilized.
 - B. Minimum requirements:
 - 1. Sized to terminate Cat 6a data termination ports and power outlets as indicated on plans.
 - 2. UL listed for scrub water test and 2-hour fire rating while maintaining fire classification of floors.
 - 3. A maximum of 50 cables per J-Hook is allowed, regardless of the manufacturer's product specification
- Backbone cabling will be labeled at all pull points and ends with water proof labels using the following color schedule:
Voice copper backbone - white
Data fiber backbone - yellow
FA fiber backbone - red

PART 3 - EXECUTION

- 3.1 GENERAL
 - Labeling details will be provided by CLPCCD ITS at the Telecom Pre-Con
- A. CLPCCD ITS will perform site walkthroughs and inspections during the construction of the telecommunications infrastructure. Coordinate at regular meetings with ITS / Salter with work performed in the field.
- B. Include the cost of all work including sub-letting of any work that may be required to complete the work indicated in order to avoid work stoppages and jurisdictional disputes. The work to be sublet will conform to precedent agreements and decisions of record. Jurisdictional assignment will be a responsibility under this Section's contractual obligation.
- C. Do not install equipment and materials that have not been reviewed by the Architect. Equipment and materials which are installed without the Architect's review or without complying to comments issued with the review will be removed from the project when so instructed by the Architect. No

payment will be made for unapproved or removal if it is ordered removed. The Installer will be responsible for any ancillary costs incurred because of its removal and the installation of the correct equipment and materials.

- D. Obtain detailed information on installation requirements from the Manufacturers of all equipment to be furnished, installed or provided. At the start of construction, check all Contract Documents, including all Drawings and all Sections of the specifications for equipment requiring electrical connections and service and verify electrical characteristics of equipment prior to roughing.
- E. Equipment and systems will not be installed without first coordinating the location and installation of equipment and systems with the General Contractor and all other Trades.
- F. Any and all material installed, or work performed in violation of above requirements will be re-adjusted and corrected by the Installer without charge.
- G. Refer to all Drawings associated with the project, prior to the installation or roughing-in of the electrical outlets, conduit and equipment, to determine the exact location of all outlets.
- H. Label all equipment as herein specified.
- I. After installation, equipment will be protected to prevent damage during the construction period. Openings in conduits and boxes will be closed to prevent the entrance of foreign materials.
- J. Home runs indicated are not to be combined or reduced without written consent from the Architect.
- K. All connections to equipment will be made as required, if applicable, and in accordance with the approved submittal and setting drawings.
- L. Site Observation:
 - 1. Site observation visits will be performed randomly during the project by the Architect. Reports will be generated noting observations. Deficiencies noted on the site visit reports will be corrected. All work will comply with the Contract Documents, applicable Codes, regulations and local Authorities whether or not a particular deficiency has been noted in a site visit report.
 - 2. Be responsible to notify the Architect ten working days prior to closing in work behind walls, raised access floors, ceilings, etc., so that installed work can be observed prior to being concealed.
 - 3. Areas will stay accessible until deficiencies are corrected and accepted. Notify the Architect when all deficiencies are corrected. Return reports with items indicated as corrected prior to re-observation by the Architect.
 - 4.
- M. Change Orders, Modifications, Revisions and Directives:
 - 1. When change orders, modifications, revisions or Architect's Directives are issued or authorized, provide the required additional material, equipment, personnel and workers to prevent delays in the work, and to complete the work within the time limit of the Contract unless a specific time extension is requested with the change and accepted. Include costs for expediting deliveries where required.
 - 2. Requests for additional compensation will be submitted broken down and associated by item, tasks and Drawing or sketch number with material and labor costs, so quantities can be easily verified.
 - 3. Requests will be properly and adequately identified so the scope of work can be clearly determined. Indicate who originated change in work.
 - 4. Submit on all credits broken down as requested for adds. Credits will be separately identified and accounted for. Do not indicate as net changes with adds.

5. Unit costs for labor and material will be equal for adds, deletes and credits.
- N. Protect existing spaces where work is being performed; protect it from damage and from the accumulation of dirt and debris.
- O. Any ceilings, walls, floors, furniture, equipment, furnishings, etc., damaged by the work of this Section will be replaced, or at the Owner's option, repaired with similar materials, workmanship and quality.
- P. Work includes field survey of existing conditions, systems, equipment and tracing of existing circuits to determine scope of work.
- Q. Maintain the existing building in operation at all times during the entire construction period. If it is necessary to have a system shutdown, a written request for approval will be submitted in advance stating the estimated shutdown time. Work will be planned to minimize shutdown. Shutdowns will be at the convenience of the Owner and, if necessary, on premium time.
- R. Clean and touch up all equipment, materials and work sites at the completion of work in each area.
- S. Certain portions of the work area may be occupied during construction. Determine which areas and schedule work accordingly and include necessary premium time.
- T. Make sure necessary provisions to provide continuous service of all existing systems throughout all occupied areas.

3.2 CABLE PATHWAYS

- A. Install cables in pathways designed to support the cables per manufacturer instructions.
- B. Provide all equipment and cabling for a complete installed operating system. Cable tray pathways, outlet boxes and grounding are provided by the Electrical Subcontractor unless otherwise noted.
- C. All pathways provided under this Section will comply with fill capacities as per Code, TIA/EIA 569 and BICSI. Coordinate with electrical contractor prior to pathway installation to verify capacity.
- D. Cable bending radius will not be less than minimum required by TIA/EIA and BICSI.
- E. Cabling installed concealed will be supported from the building structure (e.g. cable trays, J-Hooks, etc.).
- F. Cables will be installed no closer than 12 inches (305mm) to electrical equipment and wiring. When cables are required to cross power wiring, they will only do so perpendicular to the power wiring. Cable and power wiring will only cross each other the minimal number of times as required due to building design limitations.
- G. Clearances: Clearances between cabling and other building systems as required by TIA/EIA 569 and BICSI will be maintained throughout the building.
- H. All cables will be installed in a neat and workman-like manner. Cables will be installed parallel and perpendicular to building elements.
- I. Provide expansion fittings and adequate cable slack at all building expansion joints.

- J. Fire/smoke seal around all conduits, raceways, sleeves, slots, etc. where cables pass from one location to another.

3.3 WORK AREA OUTLETS

- A. All work area outlet locations will be as indicated on the Drawings. Uniquely label each work area outlet and jack within the outlet according to the numbering convention outlined in the section on labeling.
- B. Labeling shall be sequential in order, do not reuse a number throughout the entire infrastructure.
- C. Work area outlets installed in casework will have their cables installed within the conduit or raceway provided.
- D. Install jack and connector modules as indicated in the details and on the Drawings.
- E. Work area outlets will be seated properly and will be installed level on walls and parallel to building elements as required.

3.4 INSTALLATION PRACTICES

- A. Follow and adhere to installation practices specified by the applicable Telecommunications Industry Association standards.
- B. Follow and adhere to installation practices specified by the most recent edition of BICSI Information Transport System Installation Manual.
- C. Follow and adhere to installation practices specified by the latest version of BICSI Telecommunications Distribution Methods Manual .
- D. Follow and adhere to installation practices specified by the latest version of NFPA-70 National Electric Code.
- E. Follow and adhere to installation practices specified by the Manufacturers.
- F. The general topology will be a "hierarchal star" configuration. All segments will originate in UL listed patch panels located in the telecommunication equipment racks/cabinets and end at the work area outlets.
 - 1. Routing:
 - a. Cables will be routed, in large groups, down main cable pathways, until a direct path to the point of access to the workstation outlet can be taken. At that point, cables will be routed, above all building systems, to the outlet location in accordance with standard installation practices, as described herein.
 - b. Multiple cables to individual rooms will be pulled as a bundle and terminated at each end in sequential order so that labeling within a room location is in sequence.
 - c. When not in conduit or tray, cables will be supported to the deck and/or beams. Hangers, clips, and other methods of grouping the cables and keeping them away from other systems installed in the building are to be provided and installed. Ensure that hangers and other methods of securing cable do not compress cable or damage insulation.
 - d. Cables hanger will be attached to beams prior to fire proofing applications and with minimal disruption of the fireproofing. The Contractor will be responsible for restoring the fireproofing to appropriate levels. Restoration will be verified by the General Contractor. Provide documentation that installation or restoration of fire stop systems is acceptable to Owner and PM.

- e. Cable routes will be with 90-degree angles whenever possible, following building lines. Cables will not be installed randomly or diagonally through the building.
 - f. Cables installed partially or fully within the telecommunications room will be routed through and secured in the cable tray wherever possible. No cables are to be routed across the rooms at angles, or are the cables to be run from one portion of the room or tray to another. Cables placed in the cable tray are to be laced frequently to keep them neatly bundled and not permitted to shift from one side of the tray to the other as they are routed in the tray.
 - g. Station cables will be routed to fixed wall locations through EMT to back box. Secure and store 24" of slack cable above ceiling at cable entrance to EMT.
2. Separation from EMI Sources:
- a. Comply with BICSI TDMM and TIA-569 recommendations for separating unshielded copper voice and data communication cable from potential EMI sources, including electrical power lines and equipment.
 - b. Separation between open communications cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment will be as follows:
 - c. Electrical Equipment Rating Less Than 2 kVA: A minimum of 5 inches (127 mm).
 - d. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 12 inches (300 mm).
 - e. Electrical Equipment Rating More Than 5 kVA: A minimum of 24 inches (610 mm).
 - f. Separation between communications cables in grounded metallic raceways and unshielded power lines or electrical equipment will be as follows:
 - g. Electrical Equipment Rating Less Than 2 kVA: A minimum of 2-1/2 inches (64 mm).
 - h. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 6 inches (150 mm).
 - i. Electrical Equipment Rating More Than 5 kVA: A minimum of 12 inches (300 mm).
 - j. Separation between communications cables in grounded metallic raceways and power lines and electrical equipment located in grounded metallic conduits or enclosures will be as follows:
 - k. Electrical Equipment Rating Less Than 2 kVA: No requirement.
 - l. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 3 inches (76 mm).
 - m. Electrical Equipment Rating More Than 5 kVA: A minimum of 6 inches (150 mm).
 - n. Separation between Communications Cables and Electrical Motors and Transformers, 5 kVA or HP and Larger: A minimum of 48 inches (1200 mm).
 - o. Separation between Communications Cables and Fluorescent Fixtures: A minimum of 5 inches (127 mm).
3. All cables will have both ends completely terminated at their respective patch panel and work area outlet. Individual conductors will be trimmed flush with IDC block.
4. The total length of permanently installed cable for any complete segment will not exceed 295 feet (90m). Do not splice or otherwise re-terminate any cable used, terminate only at the patch panels, cross connect blocks and work area outlets. Route cables [minimum of 12 inches (305mm) away] to avoid light ballasts, transformers, power wiring and other electrical devices so that there is no EMI or RFI interference with data transmission. Permanently label all cables six inches from the connector at each end, according to the numbering convention outlined in the section on labeling. All cables will be terminated at outlets, patch panels or cross-connect blocks ONLY.
5. Maximum pulling tension will not exceed 25 lbs./ft. when installing cables.

3.5 LABELING

- A. Backbone cabling will be labeled at all pull points and ends with water proof labels using the following color schedule:
1. Voice copper Backbone – white
 2. Data fiber Backbone – yellow
 3. FA fiber Backbone – red

3.6 FIRE STOPPING

- A. Labeling details will be provided by CLPCCD ITS at the Telecom Pre-Con meeting. Fire stopping
- B. Work, in general, includes furnishing and installing fire and smoke barrier penetration sealing systems for openings in floor, walls, and other elements of construction.
- C. Comply with requirements in Division 07 Section "Penetration Fire stopping".
- D. Comply with TIA/EIA-569-A, Annex A, "Fire stopping."
- E. Comply with BICSI TDMM, "Fire stopping Systems" Article.
- F. Applicator Qualifications: Two years of experience installing UL classified fire stopping.
- G. Performance of materials will have been tested to provide fire rating equal to that of the construction.
- H. Provide standard firestop details in shop drawings that are intended for use in this project for review and approval of relevant authority.

3.7 SHOP DRAWINGS:

- A. Submit complete shop drawings coordinated where required with work of other sections.
 - 1. Shop drawings shall include horizontal cabling and BDF/IDF information only.

3.8 SEALING OF PENETRATIONS AND OPENINGS

- A. All fire stop systems will be installed in accordance with the Manufacturer's recommendations and will be completely installed and available for inspection by the local inspection authorities prior to cable system acceptance.
- B. Where possible, utilize fire stop systems that have intumescent material built in as a part of the system.
- C. Where systems with built in intumescent material are not provided, provide a seal around raceways or cables penetrating full height walls (slab to slab), floors or ventilation or air handling ducts so that the spread of fire or products of combustion will not be substantially increased, and that also maintains partition's STC rating.
- D. Penetrations through fire-resistant-rated walls, partitions, floors or ceilings will be fire stopped using approved systems and methods and UL listed products to maintain the fire resistance rating.
- E. Installation restrictions of the listing agencies will be strictly adhered to {e.g. 24 inch (610 mm) minimum horizontal separation between boxes on opposite sides of the wall, maximum square inch opening in wall}.
- F. Fire stopping in sleeves or in areas having small openings that may require the addition or modification of installed cables or raceways will be soft, pliable, non-hardening fire stop putty. Putty will be water resistant and intumescent.
- G. Fire stopping in locations not likely to require frequent modification will be UL listed putty or caulk to meet the required fire resistance rating.

- H. Box penetrations into a fire rated wall or shaft will have a fire-stopping pad installed on the back of the box.
- I. Fire stopping of cable trays through walls will be with UL listed intumescent bricks to meet the required fire resistive rating and that will not allow products of combustion to pass through the protected opening. The UL listed bags will be installed inside and on both sides of the opening as required to meet the required resistive fire rating of the wall.
- J. Fire stopping materials will be UL listed to UL 1479 (ASTM E814). Installation methods will conform to a UL fire stopping system. Submit specifications and installation drawings for the type of material to be used. Fire stopping materials will be as manufactured by 3M, International Protective Coatings Corp., Specified Technologies, Inc., Carborundum Company, RayChem, Nelson Fire Stop or approved equal.

3.9 WARRANTY REQUIREMENTS

- A. Project Warranty
 - 1. Equipment and materials required for installation under these specifications shall be the current model and new (less than one [1] year from date of manufacture), unused and without blemish or defect, and are to be guaranteed to be free from defect for a minimum of one year from date of project's substantial completion.
 - 2. When a defect or problem is observed within the first year after substantial completion, the Owner will notify the governing subcontractor through the proper channels. The appropriate Subcontractor then has 48 hours to fix the defect or furnish and install a replacement part/system, all at no cost to the project or Owner.
- B. Advanced System Warranty for Telecommunications (Copper and Fiber Systems)
 - a. This warranty shall to cover any material defect, as well as the performance of the cabling system. (Example: A Category 5e cabling system is to deliver 1000BASE-T speed, or 1 "Gig" performance for the entire length of the warranty period.)
 - b. This warranty shall cover both material and labor for the full length of the warranty period.
 - c. The Telecommunications Subcontract shall be certified by this manufacturer.
 - d. The following manufacturer is conditionally approved to provide the system warranties (subject to specific project requirements):
 - 1) Copper Connectivity Manufacturer
 - a) SYSTIMAX Category 6A cabling Infrastructure (Commscope)
 - 2) Fiber Connectivity Manufacturer
 - a) TeraSPEED Single Mode fiber, (Commscope)
 - 3) Cabling Manufacturer
 - a) SYSTIMAX Category 6A cabling Infrastructure (Commscope)

3.10 CABLE SUPPORTS

- A. Provide hook and loop (Velcro) cable wraps at all panels, equipment racks, cabinets and J-hook supports. Tie wraps are specifically prohibited.
- B. For horizontal cables, secure with minimum required compression in order to secure the cables properly without impeding the signal transmission rating (geometry) of the cable. Hook and loop (Velcro) cable wraps may be used in lieu of cable ties for copper cables only.
- C. Provide J-Hook supports from the building structure as required for cable runs to the cable drop location. Maximum distance between supports will be from 3.5 to 5.5 feet (with spacing randomly determined) depending on the structural elements of the building.
 - 1. Comply with maximum number of cables per support specified by manufacturer.

2. Provide additional supports as required when cable quantities exceed manufacturer's data, and to maintain required bending radius of cables.
3. Cables installed exposed, in areas below finished ceiling, or in inaccessible areas, shall be installed in conduit.
4. All J-Hooks supported by threaded rods only. **Drop-wires are not allowed.**

- D. All cables will be supported directly from building structure. Under no circumstance will cable be installed using cross bracing, plumbing/sprinkler pipes, ceiling systems or any other system that is not a specifically approved method to independently support cables. Cables will not be allowed to rest on ceiling tiles, duct work, piping, etc. Supports will be provided as required in order for cables to avoid contact with any other building system. Bundle cables in groups by Room.

3.11 CABLE PROTECTION

- A. Provide bushings in all metal studs and the like where cables will pass through. Bushings will be of two (2)-piece construction with one piece inserted through the opening and the second piece locking it into place. Single piece bushings with locking tabs or friction fit are specifically prohibited.
- B. Cables to be installed in existing enclosed open bays or furred spaces where conduit stubs are not provided, will be protected from chafing or any damage. The Installer will verify that the warranty will not be violated before installing any cabling in these locations.
- C. Provide cutting, coring, sleeves and bushings and seal as required at all penetrations.
- D. Cables damaged during installation will not be repaired. They will be completely replaced with new cable at no cost to the Owner.

3.12 GROUNDING & BONDING

- A. Refer to section 27 05 26 for Grounding and Bonding requirements.

3.13 DOCUMENTATION

- A. Label all equipment as herein specified.
- B. Provide:
1. Provide Building Structured Cabling Systems Administration Report indicating TIA/EIA-606 required information.
 2. Digital copies of test results for every cable segment. Documents will include measured values as well as whether or not the test passed.
 3. "Record" drawings indicating location of all equipment including but not limited to work area outlets, patch panels, cross connect blocks, on each segment and cable routing. Indicate labeling for each piece of equipment.
 4. Record drawings in digital format indicating actual cable routes and outlet identifiers. Provide respective copies mounted in each telecommunications room, and the main cross connect.
- C. Provide "as-built" Drawings on AutoCAD Version 12 or higher to the Owner in addition to .pdf copies. Obtain copy of original Drawings from the Architect.
- D. Submit UL certification that the structured cabling system meets the transmission requirements of TIA-568-C.0.

3.14 CLEANING

- A. In all telecom room spaces - a thorough sweeping, vacuuming and wet mopping shall be performed on a weekly basis or more frequently as directed by the owner. Cleaning shall include floors, rafters, floor joists, exposed structural members, exposed mechanical/electrical equipment and ductwork/piping/conduits, walls, ladder trays, tops of cabinets/racks, existing/new passive and active components, or per manufacturer recommendations.
- B. All cable managers and snap covers shall be wiped clean, both inside and outside of front, including rear channels. All clear covers and doors shall be cleaned, both front and rear per manufacturer recommendations.
- C. Inside of fiber optic enclosure and patch panels shall be blown clean of settled dust. Cleaning shall be performed for all new construction projects or where gypsum sanding has been performed.
- D. NOTE: During installation and prior to final handoff to Owner, keep all open fiber and copper ports covered utilizing plastic or tape that leaves no sticky residual.
- E. All scraps, boxes, spools, pull-line and trash shall be removed and properly disposed of.
- F. All residual cable lubricant shall be cleaned from floors and walls with an appropriate degreaser.

3.15 PROJECT CLOSEOUT

- A. Provide close out submittals as required herein and include the following close out submittals.
 - 1. Operation and Maintenance Manuals
 - 2. Record Drawings
 - 3. Test Reports
 - 4. Warranty certification from Manufacturer's
 - 5. Extra Materials
 - 6. Provide factory calibration report of field test equipment
- B. Obtain written receipts of acceptance close out submittals submitted. Receipts will specifically detail what is being delivered (description, quantity and specification section) and will be dated and signed by firm delivering materials and by the Owner's Representative.
- C. Provide As-Built drawings indicating actual cable routing and cable terminations including all required identifiers.
- D. All sketches, drawings, and charts herein are for the purpose of providing for specifications in a simplified format. Errors and omissions in such do not relieve the Contractor of the responsibility for providing a fully complete, secure and properly operating structured cabling system suitable for the intended use. Bidders must obtain a complete set of Project Drawings and Specifications to determine the full scope of work. In case of conflict, the Project Drawings and Specifications will prevail.

END OF SECTION

SECTION 27 0526 - COMMUNICATIONS GROUNDING AND BONDING

PART 1 - GENERAL

1.1 SUMMARY

- A. This section governs the products and execution requirements relating to furnishing and installing grounding and bonding for the communication systems, and supplements requirements found in related sections.
- B. Specifications and drawing package in its entirety, conditions set forth in base contract, exhibits, etc. as the items pertain to this project.
- C. Description of work:
 - 1. Furnish and install a complete and fully-functioning grounding and bonding system. All cables, terminations, support hardware, and grounding and bonding hardware shall be furnished, installed, tested, labeled, and documented by the telecommunications subcontractor.
 - a. Coordinate with electrical contractor including:
 - 1) Pathways, termination points, buss bar locations, and connections to the main electrical service ground and electrical distribution panels, conduit, fittings and bodies; bonding, Grounding cable and fittings; junction boxes; pull boxes; gutters; and measured pull tape.
- D. Related Sections:
 - 1. 270000: Communications
 - 2. 270810: Optical Fiber Testing and Measurement
 - 3. 270820: Copper Testing
 - 4. 271100: Communications Equipment Room Fittings
 - 5. 271300: Communications Backbone Cabling
 - 6. 271500: Communications Horizontal Cabling
 - 7. 271600: Communications Connecting Cords Devices & Adapters

1.2 ADDITIONAL INFORMATION

- A. Refer to Section 27 00 00 for Part 1 General information

1.3 RELATED DOCUMENTS

- A. The most recent versions of all related documents apply to this project.
- B. Comply with the following codes and standards:
 - 1. IEEE Standard 837 2002 – Standard for Qualifying Permanent Connections Used in Substation Grounding
 - 2. IEEE 142-2007 - (Green Book) - Recommended Practice for Grounding of IEEE 142-2007 - (Green Book) Industrial and Commercial Power Systems
 - 3. IEEE 1100 – 2005 - (Emerald Book) - Recommended Practice for Powering and Grounding Electronic Equipment
 - 4. IEEE Standard 1100 - IEEE Recommended Practice for Powering and Grounding Electronic Equipment (Emerald Book)
 - 5. Telecommunications Industry Association TIA-569-B-2004 Commercial Building Standard for Telecommunications Pathways and Spaces.

6. American National Standards Institute ANSI J/STD-607-A-2002 Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications.
 - C. The following guidelines shall be followed:
 1. BICSI, Telecommunications Distribution Methods Manual (TDMM)
 2. BICSI, Information Transport Systems Installation Methods Manual (ITSIMM)
 3. The following related project specifications shall be followed:
 4. Specification 27 00 00 Communications
 - D. References:
 1. American National Standards Institute (ANSI):
 - a. C80.1 Rigid Steel Conduit – Zinc Coated.
 - b. C80.4 Fittings for Rigid Metal Conduit.

 4. 651A Type EB and A Rigid PVC Conduit and HDPE Conduit.
 5. 1666 Standard for Riser Application for Optical Fiber Raceway.
 - I. Local, county, state and federal regulations and codes in effect as of date of purchase.
 - J. Equipment of foreign manufacture must meet U.S. Codes and standards. It will be indicated in the proposal the components that may be of foreign manufacture, if any, and the country of origin.
- 1.4 IDENTIFICATION FOR COMMUNICATIONS SYSTEMS
- A. The publications listed herein form a part of this specification. The publications are referred to in the text by basic designation only.
 - B. Specific reference in specifications to codes, rules, regulations, standards, manufacturer's instructions, or requirements of regulatory agencies will mean the latest printed edition of each in effect at the date of contract unless the document is shown dated.

- C. Conflicts:
1. Between referenced requirements and contract documents: Comply with the one establishing the more stringent requirements or greater quantity as per context of the document.

1.5 SUBMITTALS

- A. The Contractor will perform no portion of the work requiring submittal and review of record drawings, shop drawings, product data, or samples until the respective submittal has been approved by the Owner. Such work will be in accordance with approved submittals.
- B. Qualifications: The Contractor will submit qualification data sheets for firms and persons as specified in the "Quality Assurance" article of this specification to demonstrate their capabilities and experience.
- C. Proposed product data sheets: The Contractor will submit catalog cut-sheets that include manufacturer, trade name, and complete model number for each product specified. Model number will be handwritten and/or highlighted to indicate exact selection. Identify applicable specification section reference for each product.
- D. The following submittals are due at the Pre-Construction Phase, in accordance with submittal requirements in Section 27 00 00 Communications:
1. Product Information
 - a. Provide manufacturer's product information cut-sheet or specifications sheet with the specific product number identified.
 2. Shop Drawings
 3. Provide scaled drawings (floor plans not less than 1/16" = 1'-0") indicating the location and size, dimensions, type of connection (e.g., mechanical, exothermic weld of each bonding buss bar (e.g., TMGB, TGB), conductor (e.g., BCT, GE, TBB), connections (e.g., lugs), and splice points.
 4. Provide scaled plan and elevation drawings of telecommunications rooms (not less than 1/4" = 1'-0") indicating locations of buss bar (e.g., TMGB, TGB, UBC, RGB).
 5. Bonding and Grounding shall have its own separate drawing(s).
- E. The following submittals are due Post-Construction, in accordance with the submittal requirements in Section 27 00 00 Communications:
1. As-Built Drawings
 2. Furnish CAD drawings of completed work including cable ID numbers following the Owner's labeling standards. Submit in hardcopy (two full size and two half size) and electronic formats:
 - a. Provide scaled drawings (floor plans not less than 1/16" = 1'-0") indicating actual location and size/length of TMGB, TGBs, BCT, GE and TBB conductors and all splice points.
 - b. Provide scaled plan and elevation drawings of telecommunications rooms (not less than 1/4" = 1'-0") indicating actual locations of TMGB and TGBs.
 - c. Bonding and Grounding shall have its own separate drawing(s).
 3. Manufacturer and Maintenance Manuals for all installed equipment. This is to include:
 - a. Manufacturer specification sheets (cut sheets) and installation instructions/manuals for all installed products.
 4. A letter from the contractor Project RCDD stating that the grounding system has been installed in accordance with the project documents and the referenced codes, standards, and guidelines. This letter is to also specifically acknowledge that the telecommunications grounding system has been fully tested according to these specifications. The required contents of this letter may be incorporated into the letter required from the Project RCDD in section 27 00 00.

1.6 PROJECT CONDITIONS

- A. Field Measurements: Verify dimensions in areas of installation by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
- B. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating units without field measurements. Coordinate supports, adjacent construction, and fixture locations to ensure actual dimensions correspond to established dimensions.

1.7 COORDINATION

- A. The Electrical Contractor shall furnish and install telecommunications grounding buss bar, telecommunications bonding backbone(s), grounding equalizer(s), and equipment bonding conductors to install a complete telecommunications grounding system.
- B. Field coordinate installation of conduit and cable with other trades to ensure clearance requirements are met.
- C. Coordinate with all contractors providing equipment outside the scope of this contract.

PART 2 - PRODUCTS

2.1 GENERAL

- A. All components shall be listed by a NRTL.
- B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work are included in each product type, but are not limited to those listed.

2.2 TELECOMMUNICATIONS MAIN GROUNDING BUSS BAR (TMGB)

- A. Provide a telecommunications main grounding buss bar (TMGB) at the telecommunications service entrance (or as indicated on the drawings).
- B. The TMGB shall:
 - 1. Be a predrilled copper buss bar with holes for use with correctly matched Listed lugs and hardware.
 - 2. Have minimum dimensions of 0.25" thick by 4" wide by 20" long. Increase length as necessary to provide all connections plus 25% spare capacity.
 - 3. Be listed by a NRTL.
 - 4. Be manufactured by:
 - a. Chatsworth P/N 40153-020
 - b. Or approved alternate

2.3 TELECOMMUNICATIONS GROUNDING BUSS BAR (TGB)

- A. Provided a telecommunications grounding buss bar (TGB) in each telecommunications room.
- B. The TGB shall:
 - 1. Be a predrilled copper buss bar with holes for use with correctly matched listed lugs and hardware.

2. Have minimum dimensions of 0.25" thick by 4" wide by 10" or 12" long. Increase length as necessary to provide all connections plus 25% spare capacity.
3. Be listed by a NRTL.
4. Be manufactured by:
 - a. Chatsworth P/N 40153-012
 - b. Or approved alternate

2.4 BONDING CONDUCTOR FOR TELECOMMUNICATIONS (BCT)

- A. BCT shall:
 1. Be copper must be insulated with green insulation
 2. Be Listed for the application when insulated.
 3. As a minimum, the same size as the largest TBB.
- B. The manufacturer shall be:
 1. Harger
 2. Or approved equivalent

2.5 TELECOMMUNICATIONS BONDING BACKBONE (TBB)

- A. The TBB shall:
 1. Be copper and may be insulated.
 2. Be Listed for the application when insulated.
 3. Be sized at 3 kcmil per linear foot of conductor length up to a maximum size of 750 kcmil.

2.6 RACK BONDING CONDUCTOR (RBC)

- A. An RBC shall:
 1. Be copper and may be insulated.
 2. Be Listed for the application when insulated.
 3. Be sized as a No. 6 AWG.
- B. The manufacturer shall be:
 1. Harger
 2. Or approved equivalent

2.7 RACK GROUNDING BUSS BAR (RGB)

- A. Description: grounding Strip for 2-post and 4-post Communications Racks.
- B. A RGB shall:
 1. Be wrought copper and tin plated.
 2. Be capable of supporting multiple unit bonding conductors.
 3. Be Listed.
- C. The manufacturer shall be:
 1. Harger
 2. Panduit, Grounding Strip Kit, RGS134-1Y
 3. Or approved equivalent

2.8 GENERAL BONDING CONDUCTORS OR JUMPERS

- A. Provide and install general bonding conductors and jumpers per construction documents. Refer to drawings and execution section for required locations.

- B. For all conductors and jumpers connecting equipment located in the same room as the TMGB/TGB, conductors/jumpers shall be in a green insulated jacket. This jacket shall include markings that indicate conductor size (minimum of #6 AWG), manufacturer and UL listing.
- C. Manufacturer shall be:
 - 1. Harger
 - 2. Panduit
 - 3. Or approved equivalent

2.9 BONDING ACCESSORIES

- A. Grounding Lugs
 - 1. Shall be Listed for the application.
 - 2. Shall be two holes compression crimp with inspection window, unless otherwise noted.
 - 3. Copper or tin plated copper.
 - 4. Manufacturers shall be:
 - a. Erico, Cadweld Telecom Lugs
 - b. Harger
 - c. Framatome Connectors/Burndy Electrical.
 - d. Panduit
 - e. Or approved equivalent
- B. Unit Bonding Conductor (UBC)
 - 1. Shall be Listed for the application.
 - 2. Shall be a minimum No. 12 AWG
 - 3. Copper with 90-degree bent lugs installed.
 - 4. Manufacturers shall be:
 - a. Erico, Cadweld Telecom Lugs
 - b. Harger
 - c. Panduit
 - d. Or approved equivalent

2.10 MATERIALS

- A. All conduits, fittings, junction and pull boxes will be UL rated.
- B. All conduits, fittings, junction and pull boxes will comply with the NEC.
- C. PVC-Coated Rigid Steel Conduit and Fittings: Follow NEMA RN1 (Type A).
- D. Non-metallic Conduit and Fittings: Pass NEMA TC2, UL 651 and 651A and FS W-C- 1094A. EMT fittings will be formed steel compression ring type. Die cast fittings are not allowed.
- E. Rigid Steel Galvanized Conduit and Fittings Before Coating
 - 1. Follow FS WW-C-581d, ANSI C80.1, and UL 6.
 - 2. Pass bending, ductility, and thickness of zinc coating in ANSI C80.1.
- F. Electrical Metallic Tubing (EMT):
 - 1. EMT fittings will be formed steel compression ring type. Die cast fittings are not allowed.
 - 2. EMT will be UL listed and conform to NEC Article 300.22.
 - 3. Will be used inside buildings only.
 - 4. Only manufacturer's fittings, transition adapters, terminators and fixed bends will be used.
 - 5. All transition junction and pull boxes, fittings terminators and adapters will be a metallic material.
 - 6. Minimum average tensile strength will be 1250 lbs. For 1½-inch and smaller conduits and inner duct.

7. Minimum average tensile strength will be 1800 lbs. For conduits larger than 1½ inch.
- G. Conduit Bodies: Follow UL 514B and FS W-C-58C. Furnish sufficient coating for touch up after installation.
- H. Conduit Fittings
 1. All fittings will be compression or threaded.
 2. Fittings will provide a secure connection for pulling communications cables.
 3. Setscrew fittings are not permitted.
- I. Conduit “condulets” are not permitted. Smart LB’s are permitted.
- J. Flexible conduit is not permitted.
- K. Non-metallic conduits are not permitted in above ground installations. Conversion fittings are required for non-metallic (below ground) to metallic (above ground) transitions.
- L. Buss bars:
 1. Electrolytically-plated for reduced contact resistance
- M. Telecommunications Bonding Backbone (TBB)
 1. All Telecommunications Bonding Backbone (TBB) Cables will be insulated and installed in conduit between manholes, telecommunications closets, building steel frame and building electrical grounding system.
 2. TBB cables will interconnect all Telecommunications Grounding Buss bar (TGB) with the Telecommunications Main Grounding Buss bar (TMGB). The TBB will originate at the TMGB and extend throughout the building and connects to all the TGB’s in telecommunications closets and equipment rooms.
 3. The TBB will be installed without splices, where practicable
 4. Joined segments (conductors to buss bars) will be connected using irreversible connectors such as exothermic welding or equivalent.
 5. The TBB will be sized per table below. The TBB from TGB to the panel board in the same telecommunications space will be No. 6 AWG. All TBB connections to the TGB will utilize exothermic weld connectors.
 6. Approved bonding (Exothermic welds or double lug crimp) will be used to connect TBB from TMGB or TGB and building steel frame. All other connections will use 2-hole compression connectors.
 7. UL Listed with Flame Propagation compliant with UL 2024.
- N. Antioxidant Joint Compound for use with copper to copper bonding
 1. Approved manufacturer: Harger P/N HCAJC8
- O. Pull Boxes, Junction Boxes and Gutters
 1. All junction boxes, gutters and pull boxes will comply with NEC Article 314.
 2. All junction boxes, gutters and pull boxes will meet the following minimum material requirements:
 - a. 16-gauge steel or heavier.
 - b. Seams will be continuously welded and ground smooth.
 - c. External screws and clamps.
 - d. External mounting feet (where possible).
 - e. Oil-resistant gasket and adhesive.
 - f. ANSI 61 gray polyester powder coating inside and out over phosphatized surface.
 - g. UL 50 type 12.
 3. All junction boxes, gutters and pull boxes will be provided with bushings for conduits and/or cabling.
 4. All junction boxes, gutters and pull boxes will be securely installed.

5. All junction boxes, gutters and pull box sizes for single and multiple conduit runs will comply with BICSI TDMM.
6. All bonding conductors and connectors will be listed for the purpose intended and approved by a Nationally Recognized Testing Laboratory (NRTL).
7. All bonding conductors will be insulated and copper. The minimum bonding conductor size will be a No. 6 AWG.

PART 3 - EXECUTION

3.1 GENERAL

- A. Locate TMGB and TGBs so that they are permanently accessible to telecommunications personnel.
- B. At a minimum, follow all manufacturer instructions. In case of discrepancy between manufacturer and contractor requirements, the more stringent shall apply. In the case of conflicting instructions, report any discrepancy to the Design Engineer in a timely fashion so as not to impact the construction timeline.
- C. At a minimum, provide exothermic welds as identified on the drawings or required in the specifications. For all other connections, irreversible compression connections are sufficient.
- D. Identification
 1. All telecommunications grounding and bonding conductors shall be labeled within 6" of each end. Labels shall be nonmetallic and read as follows:

IF THIS CONNECTOR OR CABLE IS FOUND TO BE
LOOSE OR MUST BE RECONFIGURED OR REMOVED,
PLEASE CALL THE BUILDING
TELECOMMUNICATIONS MANAGER PRIOR TO ANY
FURTHER WORK

- E. Testing
 1. All grounding connections shall be tested for continuity and resistance after installation but prior to substantial completion. Refer to drawings for grounding riser and test measures. The telecommunications contractor is to invite the Design Engineer and ITS representative to witness a portion of this testing while it is being performed.
 2. The test performed shall use an earth ground resistance tester that is configured for a continuity test otherwise known as a two-point test or a "dead earth" test. Tests shall be conducted between the electrical entrance ground and the TMGB as well as at each TGB. This resistance shall be less than 0.05Ohms.
 3. Coordinate with the electrical installer for the test of the Building's Grounding Electrode System and its resistance at earth. It is recommended that this resistance measure be equal to or less than 5 ohms. Include in the grounding test report the measured resistance at the Building's Grounding Electrode System as reported by the entity performing the test.

3.2 TMGB

- A. All metallic raceways for telecommunications cabling located within the same room or space as the TMGB shall be bonded to the TMGB.

- B. Insulate the TMGB 2" from the wall.
- C. For outside plant cables entering a building with a cable shield isolation gap, bond the cable shield (on the building side of the gap) to the TMGB. Outside plant protectors shall be bonded to the TMGB with a No. 6 AWG conductor.
- D. Connections to the buss bar shall be made with 2-hole lugs.
- E. Connections shall be made by cleaning the area of connection on the buss bar and on the two-hole lug and then applying a thin coating of anti-oxidant compound.

3.3 TGB

- A. All metallic raceways for telecommunications cabling located within the same room or space as the TGB shall be bonded to the TGB.
- B. Insulate the TGB 2" from the wall.
- C. Connections to the buss bar shall be made with 2-hole lugs.
- D. Connections shall be made by cleaning the area of connection on the buss bar and on the two-hole lug and then applying a thin coating of anti-oxidant compound.

3.4 BCT

- A. Route BCT in conduit from telecommunications service entrance room to the main electrical service ground connection.
 1. Label conduit at telecommunications service entrance with tag or adhesive label that states "Building Conductor for Telecommunications (BCT) to Main Electrical Service Ground Connection".
 2. Label conduit at main electrical service ground connection with tag or adhesive label that states "Building Conductor for Telecommunications (BCT) to Telecommunications Main Grounding Buss bar (TMGB)".
 3. BCT shall not be run in a metallic conduit and shall not be completely encircled by metallic clamps.

3.5 TBB

- A. Where following the same routing as cable tray, attach TBB on the outer side of the cable tray to minimize contact with communications cabling.
- B. Size the grounding conductors according to the following table, except as it varies in the grounding riser diagram:

Sizing of the BCT & TBB	
TBB Length in Linear meters (feet)	TBB Size AWG
Less than 4 (13)	6 (16mm ²)
4-6 (14-20) 4	4 (25mm ²)
6-8 (21-26)	3 (25mm ²)
8-10 (27-33)	2 (35mm ²)
10-13 (34-41)	1 (35mm ²)
13-16 (42-52)	1/0 (50mm ²)
16-20 (53-66)	2/0 (70mm ²)
20 – 26 (67 – 84)	3/0 (85mm ²)

26 – 32 (85 – 105)	4/0 (107 mm ²)
32 – 38 (106 – 125)	250 kcmil
38 – 46 (126 – 150)	300 kcmil
46 – 53 (151 – 175)	350 kcmil
53 – 76 (176 – 250)	500 kcmil
76 – 91 (251 – 300)	600 kcmil
Greater than 91 (301)	750 kcmil

3.6 GENERAL BONDING CONDUCTORS OR JUMPERS

- A. General bonding conductors or jumpers are to be utilized in each telecommunications room between the TMGB/TGB and the following components:
1. The communications building entrance protectors.
 2. Electrical panel board (if in same room as TMGB/TGB).
 3. Building steel (if available in same room as TMGB/TGB).
 4. Telecommunications ladder rack and cable tray.
 - a. Bonding jumpers are to be utilized to ground adjacent pieces of ladder rack and cable tray together, reducing the need to a single conductor back to the TMGB/TGB.
 - b. In cases where ladder rack or cable tray is painted, prepare each section by removing paint at the connection point to ensure a completely bonded connection. If the contractor believes this is not necessary, submit documentation from manufacturer indicating NRTL testing was done in regard to grounding without removal of the paint.
 5. Telecommunications equipment racks and cabinets.
 - a. Each cabinet and rack shall be bonded to the TMGB/TGB by bonding to the row's bonding conductor with a #6 AWG RBC from the Rack Grounding Buss bar (RGB). All conductors are to be of equal length and bonded with non-reversible bonds.
 - b. In cases where racks or cabinets are painted, prepare each item by removing paint at the connection point to ensure a completely bonded connection. If the contractor believes this is not necessary, submit documentation from manufacturer indicating NRTL testing was done in regard to grounding without removal of the paint.
 - c. Bond adjacent racks and cabinets in an approved manner with # 6 AWG insulated green conductor.
 - d. Telecommunications Equipment Bonding Conductor (TEBC) bonds components within a rack or cabinet to a rack buss bar. Install a minimum of # 12 AWG insulated green conductor.
- B. Row bonding conductor
1. Install the rack or cabinet row bonding conductor sized as indicated on bonding riser and bonding detail.
 2. The default size for row bonding conductors is # 2/0 AWG.
 3. Bond to the RBC from the rack bonding jumper such that the bond of the rack jumper is laid in the direction of (or pointed to) the buss bar.

3.7 GROUNDING LUGS

- A. Wires shall be inserted to the full depth of the lug.
- B. Space between wire insulation and the body of the compression lug shall be kept to a maximum of 1/4 inch.
- C. Lug must agree with wire size.

- D. To assure proper die is used with the specified connector, manufacturer's embossed coding systems shall be adhered to.
- E. Connectors shall not be modified in any way.
- F. Daisy chaining and stacking (piggy backing) of ground lugs is prohibited.
- G. Bolts, nuts, washers used to secure ground connections shall match the diameter of the hole.

3.8 PREPARATION

- A. Contractor's on-site RCDD supervisor will review, approve and stamp all shop drawings, coordination drawings and record drawings.
- B. Verify conduit system is properly sized for cables (minimum one inch, unless otherwise noted in Drawings).
- C. Verify general conduit route following Drawings.
- D. Verify substrates to which work is connected and determine detail requirements for proper support.
- E. Verify proper location and type of rough-in for conduit, cable terminations and ground buss bar.
- F. Clean and wipe off all lugs from any oils or other debris prior to utilization.

3.9 INSTALLATION

- A. Coordinate locations with other trades prior to installation.
- B. Install work following drawings, manufacturer's instructions and approved submittal data.
- C. Installation plans and requests for information (RFIs) will be reviewed by contractor's on-site RCDD.
- D. All work will be supervised and reviewed by contractor's on-site RCDD.
- E. Check all bonds for loose connections in walk-thru prior to testing system.
- F. Test bonding of system for all metallic components back to buss bar for conformance to a 0.01 ohms maximum resistance.
- G. Locations and Types:
 - 1. Install PVC coated conduits in outdoor above-ground locations, inside valve vaults and wet wells, and in corrosive and wet environments.
 - 2. Install PVC conduits in buried duct banks or encased in concrete. Use PVC coated rigid steel for footing, slab, or other stub-outs.
 - 3. Install exposed conduit parallel or perpendicular to lines of existing construction and grouped together where possible, without interfering with use of premises or working areas. Prevent safety hazards and interference with operating and maintenance procedures.
 - 4. Conduit may pass through areas with temperature differential of 20 degrees F or more. Seal with proper fitting at barrier between areas of differing temperature.
 - 5. Do not install conduit in interference with equipment placement or operation; piping; structural members; maintenance access; indicated future equipment.

6. Contractor's RCDD supervisor will coordinate with drawings of other disciplines to determine availability of space for installation.

H. Design Considerations

1. Conduit fill will comply with ANSI/TIA/EIA-569-C.
2. The minimum bend radius is ten (10) times the conduit outside diameter (OD) for conduits 2" and greater.
3. Below grade conduit will extend four inches above finished floor (AFF) with a bushing.
4. Ceiling conduit or sleeves will extend six inches below finished ceiling with a bushing.
5. All stubbed conduit ends will be provided with a ground bushing.
6. All conduit penetrations will comply with all applicable fire codes. All conduit penetrations in fire-rated walls or floors will be sealed and fire proofed to at least the rating of the penetration area.
7. Conduits will be routed in the most direct route, with the fewest number of bends possible.
8. There will be no continuous conduit sections longer than 100 feet. For runs that total more than 100 feet, insert junction or pull boxes (or gutters if appropriate) so that no continuous run between pull boxes is greater than 100 feet.
9. There will be no more than two 90-degree bends (180 degrees total) between conduit pull boxes.
10. Changes in direction will be accomplished with sweeping bends observing minimum bend radius requirements above. Do not use pull boxes for direction changes unless specifically designated otherwise in the Drawings.
11. Unless otherwise noted in the Drawings, conduits entering pull boxes will be aligned with exiting conduits.

I. Telecommunication Bonding Backbone (TBB) Installation

1. Comply with ANSI/TIA/EIA-607.
2. TBB placed in ferrous metallic conduit that exceeds 1m(3 ft.) in length, will be bonded to each end of the conduit with a conductor sized as a NO. 6AWG, minimum.
3. The TBB conductor for telecommunications will bond the TMGB to the service equipment (power) ground.

J. Antioxidant Joint Compound for use with copper to copper bonding

1. Utilize for copper to copper connections, copper threads and all grounding/bonding applications

K. Identification: Refer to Section 27 00 00 for labeling requirements.

3.10 ACCEPTANCE

- A. Once all work has been completed, test documentation has been submitted and approved, and the Owner is satisfied that all work has been completed in accordance with contract documents, the Owner will notify Contractor in writing of formal acceptance of the system.

- B. Acceptance will be subject to completion of all work and submittal and approval of complete as-built documentation as described above, and MAA final inspection of the work for compliance with the approved as-built documentation.

END OF SECTION

SECTION 270536 - CABLE TRAYS FOR COMMUNICATIONS SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. 2.2 Ladder cable trays.
 - 2. 2.3 Wire-basket cable trays.

- B. Related Requirements:
 - 1. Section 260536 "Cable Trays for Electrical Systems" for cable trays and accessories serving electrical systems.

1.2 ACTION SUBMITTALS

- A. Product Data: For each type of cable tray.
 - 1. Include data indicating dimensions and finishes for each type of cable tray indicated.
 - 2. Shop Drawings: For each type of cable tray.
 - 3. Show fabrication and installation details of cable trays, including plans, elevations, and sections of components and attachments to other construction elements. Designate components and accessories, including velcro fasteners, brackets, hanger rods, splice-plate connectors, expansion-joint assemblies, straight lengths, and fittings.
 - 4. Seismic-Restraint Details: Signed and sealed by a qualified professional engineer, licensed in the state where Project is located, who is responsible for their preparation.
 - 5. Design Calculations: Calculate requirements for selecting seismic restraints.
 - 6. Detail fabrication, including anchorages and attachments to structure and to supported cable trays.

- B. INFORMATIONAL SUBMITTALS
 - 1. Coordination Drawings: Floor plans and sections, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
 - 2. Include scaled cable tray layout and relationships between components and adjacent structural, electrical, and mechanical elements.
 - 3. Vertical and horizontal offsets and transitions.
 - 4. Clearances for access above and to side of cable trays.
 - 5. Vertical elevation of cable trays above the floor or below bottom of ceiling structure
 - 6. Seismic Qualification Certificates: For cable trays, accessories, and components, from manufacturer.
 - 7. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 8. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 9. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
 - 10. Field quality-control reports.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR CABLE TRAYS

- A. Cable Trays and Accessories: Identified as defined in NFPA 70 and marked for intended location, application, and grounding.
 - 1. Source Limitations: Obtain cable trays and components from single manufacturer.
 - 2. Sizes and Configurations: See the Cable Tray Schedule on Drawings for specific requirements for types, materials, sizes, and configurations.
- B. Structural Performance: See articles for individual cable tray types for specific values for the following parameters:
 - 1. Uniform Load Distribution: Capable of supporting a uniformly distributed load on the indicated support span when supported as a simple span and tested according to NEMA VE 1.
 - 2. Concentrated Load: A load applied at midpoint of span and centerline of tray.
 - 3. Load and Safety Factors: Applicable to both side rails and rung capacities.

2.2 LADDER CABLE TRAYS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
- B. Basis-of-Design Product: Subject to compliance with requirements, CPI ladder racking (Chatsworth)
- C. Description:
 - 1. Configuration: Two I-beam side rails with transverse rungs welded to side rails.
 - 2. Rung Spacing: 6 inches, 9 inches, 12 inches, 18 inches o.c., as appropriate for installation
 - 3. Radius-Fitting Rung Spacing: 9 inches at center of tray's width.
 - 4. Minimum Cable-Bearing Surface for Rungs: 7/8-inch width with radius edges.
 - 5. No portion of the rungs shall protrude below the bottom plane of side rails.
 - 6. Structural Performance of Each Rung: Capable of supporting a maximum cable load, with a safety factor of 1.5, plus a 200-lb concentrated load, when tested according to NEMA VE 1.
 - 7. Minimum Usable Load Depth: 4 inches.
 - 8. Straight Section Lengths: 10 feet, 12 feet, 20 feet or 24 feet except where shorter lengths are required to facilitate tray assembly.
 - 9. Width: 12 inches, 18 inches, 24 inches or 36 inches unless otherwise indicated on Drawings.
 - 10. Fitting Minimum Radius: 12 inches
 - 11. The maximum uniform load and the support span are indicated by the cable tray class.
 - 12. Splicing Assemblies: Bolted type using serrated flange locknuts.
 - 13. Hardware and Fasteners: ASTM F 593 and ASTM F 594 stainless steel, Type 316
 - 14. Splice Plate Capacity: Splices located within support span shall not diminish rated loading capacity of cable tray.

2.3 BASKET CABLE TRAYS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

- B. Basis-of-Design Product: Legrand Cablofil
- C. Description:
1. Configuration: Wires are formed into a wire grid pattern sufficient to support the loads intended.
 2. Materials: Metallic wire.
 3. Safety Provisions: All wire ends are to be deburred during manufacturing to maintain integrity of cables and installer safety.
 4. Sizes: As indicated on plans
 5. Maximum Loads: Not to exceed manufacturer stated load limits.
 6. Connector/Splicing Assemblies: Use splice plates, CMS model CM 801-SP or functional equivalent to join each tray section to the next tray section-or to intersections.
 7. Connector/Splicing Assembly Capacity: Splices located within support span shall not diminish rated loading capacity of cable tray. Splices shall effectively act as a means to continue the bond from one tray section to the next tray section or tray intersection.
 8. Hardware and Fasteners: ASTM F 593 and ASTM F 594 stainless steel, Type 316

2.4 CABLE TRAY ACCESSORIES

- A. Fittings: Tees, crosses, risers, elbows, and other fittings as indicated, of same materials and finishes as cable tray.
- B. If more than one cable tray cover type is required, delete "Covers" Paragraph below and indicate type on Drawings or in a schedule. Retain paragraph if cable tray covers are required. See "Cable Tray Covers" Article in the Evaluations.
- C. Indicate required locations for barrier strips on Drawings.
- D. Barrier Strips: Same materials and finishes as for cable tray.
- E. Cable tray supports and connectors, including bonding jumpers, as recommended by cable tray manufacturer.

PART 3 - EXECUTION

3.1 CABLE TRAY INSTALLATION

- A. Install cable trays according to NEMA VE 2.
- B. Install cable trays as a complete system, including fasteners, hold-down clips, support systems, barrier strips, adjustable horizontal and vertical splice plates, elbows, reducers, tees, crosses, cable dropouts, adapters, covers, and bonding.
- C. Install cable trays so that the tray is accessible for cable installation and all splices are accessible for inspection and adjustment.
- D. Remove burrs and sharp edges from cable trays.
- E. Join aluminum cable tray with splice plates; use four square neck-carriage bolts and locknuts.

- F. Fasten cable tray supports to building structure and install seismic restraints as required by the structural engineer of record.
- G. Design fasteners and supports to carry cable tray, the cables, and a concentrated load of 200 lb. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems."
- H. Place supports so that spans do not exceed maximum spans on schedules and provide clearances shown on Drawings. Install intermediate supports when cable weight exceeds the load-carrying capacity of the tray rungs.
- I. Construct supports from channel members, threaded rods, and other appurtenances furnished by cable tray manufacturer. Arrange supports in trapeze or wall-bracket form as required by application.
- J. Support bus assembly to prevent twisting from eccentric loading.
- K. Install center-hung supports for single-rail trays designed for 60 versus 40 percent eccentric loading condition, with a safety factor of 3.
- L. Locate and install supports according to NEMA VE 2. Do not install more than one cable tray splice between supports.
- M. Support wire-basket cable trays directly from threaded rods or with trapeze hangers. Refer to structural drawings for mounting and bracing requirements.
- N. Support trapeze hangers for wire-basket trays with minimum 3/8-inch- diameter rods or as indicated by structural engineer of record.
- O. Make connections to equipment with flanged fittings fastened to cable trays and to equipment. Support cable trays independent of fittings. Do not carry weight of cable trays on equipment enclosure.
- P. Install expansion connectors where cable trays cross building expansion joints and in cable tray runs that exceed dimensions recommended in NEMA VE 2. Space connectors and set gaps according to applicable standard.
- Q. Make changes in direction and elevation using manufacturer's recommended fittings.
- R. Make cable tray connections using manufacturer's recommended fittings.
- S. Seal penetrations through fire and smoke barriers. Comply with requirements in Section 078413 "Penetration Firestopping."
- T. If cable trays are sized for future cables, specify provisions for penetrations with sleeves through fire-rated partitions or use "repairable" firestop-sealing material. Include this Section's specific firestopping requirements in a schedule developed in Section 078413 "Penetration Firestopping."
- U. Install capped metal sleeves for future cables through firestop-sealed cable tray penetrations of fire and smoke barriers.
- V. Install cable trays with a minimum of 24" of clearance above the tray and 24" of clearance on one sides.

- W. Cable trays are for the exclusive use of telecommunications cabling. Other cabling system must provide their own independent pathway.
- X. See "Cable Tray Covers" Article in the Evaluations.
- Y. Install permanent covers, if used, after installing cable. Install cover velcro fasteners according to NEMA VE 2.
- Z. Velcro fasteners covers on cable trays installed outdoors with heavy-duty velcro fasteners.
- AA. Install warning signs in visible locations on or near cable trays after cable tray installation.

3.2 CABLE TRAY GROUNDING

- A. Ground cable trays according to NFPA 70 unless additional grounding is specified. Comply with requirements in Section 260526 "Grounding and Bonding for Electrical Systems."
- B. Cable trays with communications cable shall be bonded together with splice plates listed for grounding purposes or with listed bonding jumpers.
- C. Cable trays with control conductors shall be bonded together with splice plates listed for grounding purposes or with listed bonding jumpers.
- D. When using epoxy- or powder-coat painted cable trays as a grounding conductor, completely remove coating at all splice contact points or ground connector attachment. After completing splice-to-grounding bolt attachment, repair the coated surfaces with coating materials recommended by cable tray manufacturer.
- E. Bond cable trays to power source for cables contained within with bonding conductors sized according to NFPA 70, Article 250.122, "Size of Equipment Grounding Conductors."

3.3 CABLE INSTALLATION

- A. Install cables only when each cable tray run has been completed and inspected.
- B. Fastening cables on horizontal runs is beyond the requirements of NFPA 70 in most cases. See Evaluations.
- C. Fasten cables on horizontal runs with cable velcro fasteners or cable ties according to NEMA VE 2. Tighten velcro fasteners only enough to secure the cable, without indenting the cable jacket. Install cable ties with a tool that includes an automatic pressure-limiting device.
- D. Fasten cables on vertical runs to cable trays every 18 inches.
- E. Length of unsupported cable is dependent on the cable diameter. See "Cable Installations" Article in the Evaluations.
- F. Fasten and support cables that pass from one cable tray to another or drop from cable trays to equipment enclosures. Fasten cables to the cable tray at the point of exit and support cables independent of the enclosure. The cable length between cable trays or between cable tray and enclosure shall be no more than 72 inches.

- G. Tie MI cables down every 36 inches where required to provide a 2-hour fire rating and every 72 inches elsewhere.
- H. In existing construction, remove inactive or dead cables from cable trays.

3.4 CONNECTIONS

- A. Remove paint from all connection points before making connections. Repair paint after the connections are completed.
- B. Connect pathways to cable trays according to requirements in NEMA VE 2 and NEMA FG 1.

3.5 FIELD QUALITY CONTROL

- A. Retain "Perform the following tests and inspections" Paragraph below to require Contractor to perform tests and inspections.
- B. Perform the following tests and inspections in-field:
 1. After installing cable trays and after electrical circuitry has been energized, survey for compliance with requirements.
 2. Visually inspect cable insulation for damage. Correct sharp corners, protuberances in cable trays, vibrations, and thermal expansion and contraction conditions, which may cause or have caused damage.
 3. Verify that the number, size, and voltage of cables in cable trays do not exceed that permitted by NFPA 70. Verify that communications or data-processing circuits are separated from power circuits by barriers or are installed in separate cable trays.
 4. Verify that there are no intruding items such as pipes, hangers, or other equipment in the cable tray.
 5. Remove dust deposits, industrial process materials, trash of any description, and any blockage of tray ventilation.
 6. Visually inspect each cable tray joint and each ground connection for mechanical continuity. Check bolted connections between sections for corrosion. Clean and retorque in suspect areas.
 7. Check for improperly sized or installed bonding jumpers.
 8. Check for missing, incorrect, or damaged bolts, bolt heads, or nuts. When found, replace with specified hardware.
 9. Perform visual and mechanical checks for adequacy of cable tray grounding; verify that all takeoff raceways are bonded to cable trays. Test entire cable tray system for continuity. Maximum allowable resistance is 1 ohm.
 10. Prepare test and inspection reports and furnish to design team

3.6 PROTECTION

- A. Protect installed cable trays and cables.
- B. Install temporary protection for cables in open trays to safeguard exposed cables against falling objects or debris during construction. Temporary protection for cables and cable tray can be constructed of wood or metal materials and shall remain in place until the risk of damage is over.

- C. Repair damage to galvanized finishes with zinc-rich paint recommended by cable tray manufacturer.
- D. Repair damage to paint finishes with matching touchup coating recommended by cable tray manufacturer.

END OF SECTION

SECTION 27 0810 - OPTICAL FIBER TESTING AND MEASUREMENTS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes: Products and execution requirements relating to testing and documentation for optical fiber cabling for the communication systems, and supplements requirements found in related sections.

1.2 WORK INCLUDED

- A. Provide all labor, materials, tools, field-test instruments, and equipment required for the complete testing, identification and administration of the work called for in the Contract Documents.
- B. In order to conform to the overall project event schedule, the cabling contractor shall survey the work areas and coordinate cabling testing with other applicable trades.
- C. In addition to the tests detailed in this document, the contractor shall notify the Owner or the Owner's representative of any additional tests that are deemed necessary to guarantee a fully functional system. The contractor shall carry out and record any additional measurement results at no additional charge.

1.3 SCOPE

- A. This Section includes the minimum requirements for the test certification, identification and administration of backbone and horizontal optical fiber cabling.
- B. This Section includes minimum requirements for:
 - 1. Fiber optic test instruments
 - 2. Fiber optic testing
 - 3. Identification
 - a. Labels and labeling
 - 4. Administration
 - a. Test results documentation
 - b. As-built drawings
- C. Testing shall be carried out in accordance with this document. This includes testing the attenuation and polarity of the installed cable plant with an optical loss test set (OLTS) and the installed condition of the cabling system and its components with an optical time domain reflectometer (OTDR).
- D. Testing shall be performed on each cabling link (connector to connector).
- E. Testing shall be performed on each cabling channel (equipment to equipment) that is identified by the owner.
 - 1. Testing shall not include any active devices or passive devices within the link or channel other than cable, connectors, and splices, i.e. link attenuation does not include such devices as optical bypass switches, couplers, repeaters, or optical amplifiers.

- F. All tests shall be documented including OLTS dual wavelength attenuation measurements for singlemode links and channels and OTDR traces and event tables for singlemode links and channels.
 - 1. Optionally documentation shall also include optical length measurements and pictures of the connector end face.

1.4 RELATED DOCUMENTS

- A. Specifications and drawing package in its entirety, conditions set forth in base contract, exhibits, etc. as the items pertain to this project.
- B. Related Sections:
 - 1. 270000: Communications
 - 2. 270526: Grounding and Bonding of Communication Systems
 - 3. 270820: Copper Testing
 - 4. 271100: Communications Equipment Room Fittings
 - 5. 271300: Communications Backbone Cabling
 - 6. 271500: Communications Horizontal Cabling
 - 7. 271600: Communications Connecting Cords Devices & Adapters

1.5 DEFINITIONS

- A. See Section 270000

1.6 QUALITY ASSURANCE

- A. Comply with testing procedures and field-test instruments in the applicable requirements of:
 - 1. ANSI Z136.2, ANS For Safe Use Of Optical Fiber Communication Systems Utilizing Laser Diode And LED Sources
 - 2. TIA -526-7-A, Optical Power Loss Measurements of Installed Singlemode Fiber Cable Plant.
 - 3. IEC 61300-3-35, Automated End Face Grading
- B. Field Testing review by owner or owner's representative
 - 1. Provide notification a minimum of five (5) business days prior to field-testing start date
 - 2. A random test sample of the installed links will be compared to contractor supplied test results, if more than 2% of the sample deviates from the contractor's results, the contractor shall repeat 100% of the testing.
- C. Testing technicians shall be certified in fiber optic testing including OLTS and OTDR test equipment from an industry manufacturer or industry training organization such as BICSI.

1.7 SUBMITTALS

- A. Technician training certifications for fiber optic testing
- B. Manufacturers data sheets and specifications for the fiber optic field-test instruments including:
 - 1. OTDR
 - 2. OLTS
 - 3. Endface inspection capture device
- C. Sample test reports.

- D. A schedule (list) of all optical fibers to be tested.
- E. Manufacturer factory cable spec sheet and test results for fiber shipped.

1.8 CLOSEOUT SUBMITTALS

- A. Provide test data archive for future maintenance and establish the fiber optic plant baseline.
 - 1. Test shall be organized by media in binders with index and pagination.
 - 2. Field-instrument test results documentation
 - a. Provide electronic raw and unaltered data files from the field-test instrument
 - b. Provide the viewing software for the above file.
 - 3. Submit a spreadsheet in hardcopy and in an electronic file format acceptable to the owner.
 - a. Convert raw data files from the field-test instruments into an archiving utility spreadsheet for the maintenance, and inspection test records.
 - b. Provide the following information about the test in the spreadsheet:
 - 1) Site name as specified by the owner
 - 2) The standard selected to execute the test results
 - 3) Test date
 - 4) Manufacturer, model and serial number of the field-test instruments
 - 5) Version of the test software and the version of the test standards database in the test instrument
 - 6) OLTS Mandel sizes used for each cable type
 - 7) Index of refraction value used for length calculations
 - 8) Names of people performing the testing
 - c. Provide the following information for each tested optical fiber in the spreadsheet:
 - 1) Fiber identification number
 - a) If this number varies from the cable label, provide a cross reference.
 - 2) Length for each optical fiber calculated by the OLTS
 - 3) Length for each optical fiber calculated by the OTDR
 - 4) Automated End Face Grading
 - 5) Test results to include OLTS attenuation link and channel measurements at 1310 nm and 1550 nm for singlemode cabling and the margin (difference between the measured attenuation and the test limit value).
 - 6) Test results shall be submitted to include OTDR link and channel traces and event tables at 1310 nm and 1550 nm for singlemode cabling and the margin (difference between the measured attenuation and the test limit value).
 - 7) A picture or image of each fiber end-face.
 - 8) The overall Pass/Fail evaluation of the link-under-test for OLTS and OTDR measurements.

1.9 TESTING RESULTS

- A. Link attenuation measurement and calculation
 - 1. Link attenuation calculation allowance = Cable Attenuation Allowance (dB) + Connector Insertion Loss Allowance (dB) + Splice Insertion Loss Allowance (dB) where:
 - a. Connector Insertion Loss Allowance (dB) = Number of Connector Pairs × 0.4dB
 - b. Splice Insertion Loss Allowance (dB) = Number of Splices × 0.15dB
 - c. Cable Attenuation Allowance (dB) = Maximum Cable Attenuation Coefficient (dB/km) × Length (km)

Optical fiber and cable type	Wavelength (nm)	Maximum attenuation (dB/km)
Singlemode Indoor-Outdoor (OS2)	1310	0.5
	1550	0.5
Singlemode Inside Plant (OS2)	1310	1.0
	1550	1.0
Singlemode Outside Plant (OS2)	1310	0.5
	1550	0.5

Table 1-1 Optical fiber cable attenuation performance (Ref. TIA-568-C.3 Table 1)

- B. Field testing cabling links
 - 1. Correct any fiber links that fail attenuation measurement and allowance calculation, or OTDR analysis.
 - 2. Document all corrective action.
 - 3. Retest all failed fiber links after corrective action.
 - 4. Provide testing documentation for corrected fiber links.

- C. Evaluate Individual connector, splice and fiber insertion loss using the OTDR trace and ensure these components meet or exceed the values in table 1-1.

PART 2 - PRODUCTS

2.1 OPTICAL FIBER CABLE TESTERS

- A. Ensure the field-test instrument is updated to the most recent software and firmware provided by the manufacturer prior to testing.

- B. Optical loss test set (OLTS)
 - 1. Calculate the length of fiber links
 - 2. Singlemode optical fiber light source
 - a. Provide dual laser light sources with central wavelengths of 1310 nm (± 20 nm) and 1500 nm (± 20 nm)
 - b. Output power of -10 dBm minimum
 - 3. Power Meter
 - a. Provide 850 nm, 1300 nm, 1310 nm, and 1500 nm wavelength test capability
 - b. Power measurement uncertainty of ± 0.25 dB
 - c. Store reference power measurement
 - d. Store a minimum of 100 results in internal memory
 - e. External computer interface (serial or USB)
 - 4. Acceptable Equipment:
 - a. Fluke Networks, CertiFiber Pro
 - b. Fluke Networks, DSX 5000 Cable Analyzer with all associated modules
 - c. Exfo, MaxTester 940
 - d. Approved equivalent

- C. Optical Time Domain Reflectometer (OTDR)
 - 1. Shall have a color transmissive LCD display with backlight
 - 2. Rechargeable Li-Ion battery for 8 hours of normal operation
 - 3. Internal non-volatile memory and removable memory device with at least 16 MB capacity for results storage

4. Serial and USB ports to transfer data to an external computer
 5. Single-mode OTDR
 - a. Wavelengths of 1310 nm (± 25 nm) and 1550 nm (± 30 nm)
 - b. Event dead zones typically of 1 m at 1310 nm and 1 m at 1550 nm
 - c. Attenuation dead zones typically of 8 m at 1310 nm and 8 m at 1550 nm
 - d. Distance range at least 60 km
 - e. Dynamic range 26 dB at 1310 nm and 24 dB at 1550 nm
 6. Acceptable Equipment:
 - a. Fluke Networks, OptiFiber Pro
 - b. Corning Cabling Systems, OV-1000 OTDR
 - c. Exfo, FTB-150 OTDR
 - d. Approved equivalent
- D. Fiber Video Scope
1. Field of view at least 250 μ m
 2. Video camera and display showing magnified end-face image.
 3. Camera probe tips permitting inspection through adapters.
 4. Electronic storage of end-face image.
 5. Acceptable Equipment:
 - a. Fluke Networks, Versiv (CertiFiber Pro, OptiFiber Pro or FI-7000)
 - b. Exfo MaxTester 940
 - c. Approved equivalent
- E. Fiber Cleaning Products
1. Optical-grade cleaning fluids that leave no residue and are fast-evaporating
 2. Cleaning fluids in hermetically sealed packaging to prevent cross-contamination
 3. High-absorbency optical-grade fabric wipes (not paper)
 4. Acceptable Manufacturers: Sticklers; or approved Alternate

PART 3 - EXECUTION

3.1 GENERAL

- A. All tests performed on optical fiber cabling that use a laser or LED in a test set shall be carried out with safety precautions in accordance with ANSI Z136.2.
- B. Provide all labor, materials, tools, and test equipment for the testing and measurement of the installed optical fiber cabling.
- C. Coordinate the optical fiber testing with other applicable trades.
- D. Notify the Owner or the Owner's representative of any non-specified tests deemed necessary to guarantee a fully functional system.
- E. Provide system closeout documentation including test measurement results in electronic spreadsheet format and native file format from the test instrument along with viewing software prior to final acceptance.
- F. Provide test measurements carried out in accordance with the Tier 2 specification of TIA-568, plus an image capture of connector end-faces. Include length measurement, attenuation measurement, verifying polarity (using an optical loss test set (OLTS) and obtaining a trace and event table of the fiber with an optical time domain reflectometer (OTDR).

- G. Perform single direction testing with an OLTS.
- H. Perform bi-directional OTDR testing with a launch and tail fiber on each optical fiber cabling link (adapter to adapter) reporting the bi-directional average.
- I. Provide testing documentation for:
 - 1. Single mode links (1310 nm and 1550 nm)
 - 2. OLTS length measurements for singlemode links
 - 3. OTDR traces and event tables for singlemode links
 - 4. Image captures of connector end-faces.
- J. Observe safety precautions in ANSI Z136.2 for testing that use lasers or LED light sources
 - 1. High power light sources should not be directly viewed, use indirect viewing by pointing the end of the fiber at an adjacent surface to determine the presence of light.
- K. Calibrate the field-test instruments as recommended by the manufacturer, or at least within one year of project test measurements. The field-test instrument shall contain the most recent software and firmware provided by the manufacturer prior to testing.
- L. Prior to testing, the labels for all outlets, cables, patch panels and associated components must be in place. Testing performed prior to proper labeling shall be retested.
- M. Visually inspect and clean all fiber connectors immediately prior to testing. Utilize high-quality fiber test reference leads and verify every 288 test cycles. The test reference cord verification result shall be stored and submitted as part of the overall test results submission.
 - 1. Verify the condition of the fiber end faces as well as the test leads *prior* to testing.
 - 2. Provide documentation to prove this step was taken.
- N. Perform testing on each cabling segment in accordance with TIA-568, Tier 2 including:
 - 1. verify polarity
 - 2. measuring length
 - 3. OLTS attenuation measurement
 - 4. OTDR trace analysis
- O. Record an image of each fiber optic connector endface for the closeout documentation.
- P. Submit the optical fiber link test results from the OLTS, and OTDR field-test instruments as part of the closeout documentation.
- Q. Place dust caps on fiber endfaces or adapters on completion of all testing.

3.2 OPTICAL FIBER CLEANING REQUIREMENTS

- A. Utilize wet-dry cleaning methods for removing all forms of contamination and eliminates electrostatic charge.
- B. Use optical-grade cleaning fluids that leave no residue and are fast-evaporating.
- C. Use cleaning fluids in hermetically sealed packaging to prevent cross-contamination. Refillable pump bottles are not acceptable.
- D. Use high-absorbency optical-grade fabric wipes (not paper)
- E. Always clean both ends of a connector pair, and do it just before mating.

- F. Visually inspect and clean new jumpers and patch cords, even if right out of the bag, even if they have protective dust covers on them.
- G. When using stick cleaners, use one stick per end-face to avoid cross contamination.
- H. When using cleaning sticks, only rotate them in one direction: usually four to eight rotations is sufficient.
- I. Mechanical "push-to-clean" cleaners and cassette cleaners are acceptable for light to medium levels of contaminations
- J. Use boxes and tubs of optical -grade wipes plus a cleaning fluid when splicing, regards to pigtails onto bulk cable.
- K. Always clean test assemblies, power meters, light sources and all the other equipment and test gear prior to starting work.

3.3 TESTING PROTOCOL

- A. Provide a testing protocol 1 month prior to testing that will be used in testing of all installed links for review by Owner and consultant prior to implementation.

3.4 OPTICAL FIBER TESTING REQUIREMENTS

- A. OTDR testing
 - 1. Reflective events (connections) shall not exceed 0.40 dB.
 - 2. Non-reflective events (splices) shall not exceed 0.15 dB.
- B. Magnified end face inspection
 - 1. Fiber connections shall be visually inspected for end face quality.
 - 2. Scratched, pitted or dirty connectors shall be diagnosed and corrected.
- C. Perform Automated End Face Grading PRIOR to testing cable plant. Provide test results of this grading.
- D. All installed cabling links and channels shall be field-tested and pass the test requirements and analysis as described in Part 3. Any link or channel that fails these requirements shall be diagnosed and corrected. Any corrective action that must take place shall be documented and followed with a new test to prove that the corrected link or channel meets performance requirements. The final and passing result of the tests for all links and channels shall be provided in the test results documentation in accordance with Part 3.
- E. Acceptance of the test results shall be given in writing after the project is fully completed and tested in accordance with Contract Documents and to the satisfaction of the Owner.

Note: High Bandwidth applications such as 10GBASE-SR, 40GBASE-SR4, 100GBASE-SR4 and FC1200 impose stringent channel loss limits. Certification shall consider loss length limits that meet maximum channel (transmitter to receiver) loss. Links not in compliance, even though connectivity testing is within loss limits, must be brought to the attention of the Owner or Owner's Representative.

- F. Polarity
 - 1. For duplex connector systems, verify polarity with an OLTS

- G. Length measurement
 - 1. Measure each optical fiber link with the OLTS and OTDR for its length and submit with the closeout documentation

- H. Attenuation measurement (OLTS)
 - 1. General
 - a. Turn on optical light sources for a minimum of 5 minutes prior to referencing.
 - b. Test jumpers shall be reference quality and between 1 m and 5 m in length.
 - c. Reference the light source to the meter a minimum of twice daily
 - d. Fiber test jumpers shall be of the same type, core size and match the performance specifications as the cabling under test
 - e. Clean and allow sufficient time for cleaning solution evaporation, of Fiber test jumpers and fiber links immediately prior to each connection of the test instrument
 - f. Do not remove the test jumper connected to the source after referencing to prevent adverse influence on the attenuation measurement. If the test jumper is disconnected, re-reference to the light source.
 - g. Test singlemode optical fiber at 1310 nm and 1550 nm as referenced in ANSI/TIA-526-7-A, Single Cord Test Reference.
 - h. Measure and report attenuation in one direction for OLTS measurements.
 - i. Measure and report attenuation in both directions for OTDR measurements. (Averaged in both directions)

- I. Optical fiber endface image
 - 1. Capture and record an image of each optical fiber after completing Tier 2 testing of the optical fiber link using either a video fiber scope with at least a 250 μm field of view.

- J. Encircled Flux
 - 1. The launch shall be compliant with ANSI/TIA-526-14-C.
 - 2. VCSEL lasers are not acceptable
 - 3. Utilize testers that can give you an automated pass/fail tests.

- K. OTDR trace analysis
 - 1. Provide an OTDR trace of each optical fiber link in one direction to ensure uniformity of cable attenuation and connector insertion loss
 - 2. Provide and install a launch cable of the same type as the fiber link under test and as specified by the OTDR manufacturer for installation between the OTDR and the first link connection
 - 3. Provide a receive cable, installed after the last link connection as part of the OTDR trace of at least 100 m (328 ft.) in length and of the same fiber type as the link under test.

3.5 IDENTIFICATION

- A. Labeling
 - 1. Labeling shall conform to the requirements specified within ANSI/TIA-606-B or to the requirements specified by the Owner or the Owner's representative.

3.6 ADMINISTRATION

- A. Test results documentation
 - 1. Test results saved within the field-test instrument shall be transferred into a Windows™-based database utility that allows for the maintenance, inspection and archiving of the test records. These test records shall be uploaded to the PC unaltered,

- i.e., "as saved in the field-test instrument". The CSV file format (comma separated value), does not provide adequate protection of these records and shall not be used.
2. The test results documentation shall be available for inspection by the Owner or the Owner's representative during the installation period and shall be passed to the Owner's representative within 5 working days of completion of tests on cabling served by a telecommunications room or of backbone cabling. The installer shall retain a copy to aid preparation of as-built information.
 3. The database for the complete project, including twisted-pair copper cabling links, if applicable, shall be stored and delivered on a Contractor-Furnished USB memory card prior to Owner acceptance of the building. This USB Memory stick shall include the software tools required to view, inspect, and print any selection of the test reports.
 4. Circuit IDs reported by the test instrument should match the specified label ID (see 3.5 of this Section).
 5. The detailed test results documentation data is to be provided in an electronic database for each tested optical fiber and shall contain the following information
 - a. The identification of the customer site as specified by the end-user
 - b. The name of the test limit selected to execute the stored test results
 - c. The name of the personnel performing the test
 - d. The date and time the test results were saved in the memory of the tester
 - e. The manufacturer, model and serial number of the field-test instrument
 - f. The version of the test software and the version of the test limit database held within the test instrument
 - g. The fiber identification number
 - h. The length for each optical fiber
 - i. Optionally the index of refraction used for length calculation when using a length capable OLTS
 - j. Test results to include OLTS attenuation link and channel measurements at the appropriate wavelength(s) and the margin (difference between the measured attenuation and the test limit value).
 - k. Test results to include OTDR link and channel traces and event tables at the appropriate wavelength(s).
 - l. The length for each optical fiber as calculated by the OTDR.
 - m. The overall Pass/Fail evaluation of the link-under-test for OLTS and OTDR measurements
 - n. Optional
 - 1) A picture or image of each fiber end-face
 - 2) A pass/fail status of the end-face based upon visual inspection.
 6. Provide summary report of all cables tested in PDF format.
 7. Provide full tester report for each cable tested in PDF format.
 8. Provide the following per CLPCCD standards:
 - a. Native files from test instrument (e.g, .flw if Fluke tester is used)
 - b. Interpreting software (e.g. Linkware)
 - c. Formatted test report in .pdf format
- B. As indicated in 27 00 00, all documentation will be provided in soft and hard bound copies. Hard copies are to be included in an indexed binder with each test or document residing in its own section and listed in the table of contents for easy reference.

END OF SECTION

SECTION 27 0820 - COPPER TESTING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes: Products and execution requirements relating to testing and documentation for copper cabling for the communication systems, and supplements requirements found in related sections.
- B. Test measurements shall be taken for all balanced-twisted pair cabling, including horizontal and backbone copper cables and wall-to-rack cables. Test all category cables in accordance with current TIA measurement specifications for that category of cabling with a field-test instrument meeting or exceeding Level IIIe accuracy. Provide test measurement results (in electronic format) a minimum of three weeks prior to substantial completion.

1.2 RELATED DOCUMENTS

- A. Related Sections:
 - 1. 270000: Communications
 - 2. 271500: Communications Horizontal Cabling
 - 3. 271600: Communications Connecting Cords Devices & Adapters
- B. The latest versions of the following codes, standards, and guidelines shall be followed. Bring to ITS' immediate attention where construction documents or conditions differ from requirements in codes, standards, guidelines and specifications.
- C. The latest edition of the following standards:
 - 1. ANSI/TIA-568 – Balanced Twisted-Pair Telecommunications Cabling and Components Standard
 - 2. ANSI/TIA-1152 – Requirements for Field Test Instruments and Measurements for Balanced Twisted-Pair Cabling
 - 3. TIA TSB-155 - Guidelines for the Assessment and Mitigation of Installed Category 6A Cabling to Support 10GBASE-T
- D. The following guidelines:
 - 1. BICSI, Telecommunications Distribution Methods Manual (TDMM)
 - 2. BICSI, Information Transport Systems Installation Methods Manual (ITSIMM)

1.3 QUALITY ASSURANCE

- A. All testing procedures and field-test instruments shall comply with applicable requirements of referenced standards.
- B. Test measurements shall be performed by trained technicians who have successfully attended manufacturer training.
- C. The Owner or the Owner's Representative shall be invited to witness, review or both witness and review field-testing.
 - 1. Notify Owner's Representative and Design Engineer of the testing start date, five (5) business days before testing commences.

1.4 SUBMITTALS

- A. The following submittals are due a minimum of three weeks prior to substantial completion, in accordance with the submittal requirements in Section 27 00 00 Communications:
 - 1. Complete test measurement results indicating that all cable permanent links have passed. Submit (2) electronic versions to the Owner's Representative and one for the Design Engineer – Ryan Raskop):
 - a. Microsoft Excel 2010 or later (Manifest)
 - b. Test measurement results in their native format and the manufacturer's PC software to read test results.
 - c. Test shall be organized by media in binders with index and pagination
 - d. Manufacturer factory cable spec sheet and test results for shipped cable.
- B. The following submittals are due Post-Construction, in accordance with the submittal requirements in Section 27 00 00 Communications:
 - 1. On final electronic file submittal (CD/DVD-R or USB Flash Drive), which is to include record drawings, O&M manuals, etc., also include files for all valid test results (as submitted previously).

PART 2 - PRODUCTS

2.1 FIELD-TEST INSTRUMENT

- A. The field-test instrument shall:
 - 1. Be calibrated field-test instruments as recommended by the manufacturer, or at least within one year of project test measurements.
 - 2. Contain the most recent software and firmware provided by the manufacture prior to testing.
 - 3. Be Level IIIe accuracy.
- B. Administration
 - 1. The test measurement result information for each link shall be recorded in the memory of the field-test instrument upon completion of the test.
- C. Approved Products:
 - 1. Fluke DSX-5000 and all associated modules
 - 2. Or Pre-Approved Equivalent: Provide supporting documentation that substantiates claim.

PART 3 - EXECUTION

3.1 GENERAL

- A. All outlets, cables, patch panels and associated components shall be fully assembled, secured/affixed to final mount location, and labeled prior to field-testing. Any test measurements performed on incomplete systems shall be redone on completion of the work.
- B. Tester shall be configured with the manufacturer and model number of cable and connectors, where applicable.

- C. The installed twisted-pair links shall be tested from the telecommunications room to the telecommunication wall outlet in the work area for compliance with the "Permanent Link" performance specification.
- D. Trained technicians who have successfully attended an appropriate training program and have obtained a certificate as proof thereof shall execute the tests. The test equipment (tester), including the appropriate interface adapter, shall comply with the accuracy requirements for Level IIIe field-test instruments as defined in ANSI/TIA-1152. The accuracy requirements for the permanent link test configuration (baseline accuracy plus adapter contribution) are specified in Table 2 of ANSI/TIA-1152 (Table 2 in this TIA document also specifies the accuracy requirements for the Channel configuration).
- E. One hundred percent of the installed cabling links shall pass the requirements of the referenced standards. Diagnosed and correct any failing link.
 - 1. Note and follow with a new test measurement the corrective action to prove that the corrected link meets the performance requirements.
- F. A PASS or FAIL result for each parameter is determined by comparing the measured values with the specified test limits for that parameter. The test result of a parameter shall be marked with an asterisk (*) when the result is closer to the test limit than the accuracy of the field tester. The field-test instrument manufacturer must provide documentation as an aid to interpret results marked with asterisks. To which extent '*' results shall determine approval or disapproval of the element under test shall be defined in the relevant detail specification, or agreed on as a part of a contractual specification.
- G. The Pass or Fail condition for the link-under-test is determined by the results of the required individual tests. Any FAIL, FAIL* or PASS* result is considered a FAIL for the link-under-test for this contract. In order to achieve an overall Pass condition, the results for each individual test parameter must yield a rating of PASS. The "*" shall not be turned off on the test instrument.
- H. The records for each cable test measurement shall be provided to the owner a maximum of two weeks after substantial completion in Excel format (manifest) and the native format to the field-test instrument. The Owner can supply an Excel spreadsheet template (manifest) upon request for the contractor's use.

3.2 PERFORMANCE TEST PARAMETERS

- A. Test parameters for category 6A Cables:
 - 1. Wire map
 - 2. Length
 - 3. Propagation delay
 - 4. Delay skew
 - 5. DC Loop Resistance
 - 6. Shield continuity for shielded cables
- B. Test parameters for Category 6A cables (up to 500 MHz):
 - 1. Wire Map
 - 2. Length
 - 3. IL - Insertion Loss
 - 4. NEXT – Near End Cross-Talk
 - 5. PSNEXT - Power Sum Near End Crosstalk
 - 6. ACRF - Attenuation to Crosstalk Ratio – Far End
 - 7. PSACRF - Power Sum Attenuation to Crosstalk Ratio – Far End

8. PSANEXT - Power Sum Alien Near End Crosstalk
9. PSAACRF - Power Sum Alien Attenuation-to-Crosstalk-Ratio from the Far End
10. RL - Return Loss
11. Propagation Delay
12. Delay Skew
13. Shield continuity for shielded cables
14. DC Loop Resistance for balanced and unbalanced signals
 - a. Max 21 ohms

C. Alien Crosstalk sampling

1. Shall be performed for Category 6A cables used for 10Gb/s, and all Category 6A cables in the same bundle as well as adjacent links, using a sampling plan. An acceptance quality level (AQL) of 0,4 %, normal inspection, general inspection level I as defined in ISO 2859-1 for populations of up to 500,000 links shall be used. The following table represents this sampling level:

Total number of links (N)	Sample size (No. of links to test)
3 – 33	3 or 0.1 x N (whichever is greatest)
34 – 3,200	33
3,201 – 35,000	126
35,001 – 150,000	201
150,001 – 500,000	315

D. Test parameters for other cables:

1. Continuity to the remote end;
2. Shorts between any two or more conductors;
3. Crossed pairs;
4. Reversed pairs;
5. Split pairs;
6. Shield continuity for shielded cables, and
7. Any other miss-wiring.

3.3 TESTING PROTOCOL

- A. Provide a testing protocol 1 month prior to testing that will be used in testing of all installed links for review by Owner and consultant prior to implementation.

3.4 ADMINISTRATION

A. Test results documentation

1. The test results documentation shall be available for inspection by the Owner or the Owner's representative during the installation period. The contractor shall retain a copy to aid preparation of as-built information.
2. Circuit IDs reported by the field-test instrument shall match the label ID specified by the Owner.
3. The detailed test results documentation data is to be provided in an electronic database for each tested link and shall contain the following information
 - a. The identification of the customer site as specified by the end-user
 - b. The name of the standard selected to execute the stored test results
 - c. The name of the test personnel
 - d. The date and time the test results were saved in the memory of the tester

- e. The manufacturer, model and serial number of the field-test instrument
 - f. The version of the test software and the version of the test standards database held within the test instrument
 - g. The copper identification number
 - h. The length for each copper cable
 - i. The overall Pass/Fail evaluation of the channel test.
4. Provide summary report of all cables tested in PDF format.
 5. Provide full tester report for each cable tested in PDF format.
 6. Ensure that sweep frequency measure graphs are included in reports.

END OF SECTION

SECTION 27 1100

COMMUNICATIONS EQUIPMENT ROOM FITTINGS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes basic communications room requirements, and supplements requirements found in related sections. Refer to "T" series drawings for specific communication room requirements:
- B. Related Sections
 - 1. 061000: Rough Carpentry
 - 2. 270000: Communications
 - 3. 270526: Grounding and Bonding of Communication Systems
 - 4. 270810: Optical Fiber Testing and Measurement
 - 5. 270820: Copper Testing
 - 6. 271300: Communications Backbone Cabling
 - 7. 271500: Communications Horizontal Cabling
 - 8. 271600: Communications Connecting Cords Devices & Adapters

1.2 SCOPE OF WORK

- A. Provide all labor, materials, tools and equipment required for the complete and proper communications equipment room fittings installation.
- B. In order to conform to the overall project event schedule, the contractor shall survey and coordinate the communications equipment room fittings installation with other applicable trades.
- C. In addition to the details specified within this Section, the contractor shall notify the Owner's Representative of any additional items deemed necessary to guarantee a fully functional system. The contractor shall furnish and install all necessary items for a fully functional system at no additional charge.
- D. Furnish and install the following as indicated on the plans:
 - 1. Racks
 - 2. Cabinets
 - 3. Enclosures
 - 4. Cable runway and accessories
 - 5. Cable management panels.
 - 6. Building entrance terminal and protectors.
 - 7. Primary and secondary building entrance protection
 - 8. Patch panels and other connecting hardware as needed
 - 9. Backboards

1.3 DEFINITIONS

- A. Basket Cable Tray: A fabricated structure consisting of an integrated, welded wire grid of bottom and side rails.

- B. Equipment Room: An environmentally controlled centralized space for telecommunications equipment that usually houses a main or intermediate cross-connect and security equipment (ER). Sometimes referred to as MDF.
- C. Entrance Facility: A space in a building which the joining of campus to building telecommunications backbone facilities takes place (EF).
- D. Ladder Cable Tray: A fabricated structure consisting of two longitudinal side rails connected by individual transverse members (rungs).
- E. Telecommunications Room: An environmentally enclosed architectural space designed to contain telecommunications equipment, cable terminations, or cross-connect cabling and security equipment (TR). Sometimes referred to as an IDF.

1.4 SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for equipment racks and cabinets. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- B. Shop Drawings: For communications equipment room fittings. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 2. Equipment Racks and Cabinets: Include workspace requirements and access for cable connections.
 - 3. Grounding: Indicate location of grounding bus bar and its mounting detail showing standoff insulators and wall mounting brackets.
- C. Remaining paragraphs are defined in Division 01 Section "Submittal Procedures" as "Informational Submittals."
- D. Coordinate first paragraph below with qualification requirements in Division 01 Section "Quality Requirements" and as supplemented in "Quality Assurance" Article.
- E. Qualification Data: For installers, qualified layout technician, installation supervisor, and field inspector.
- F. Seismic Qualification Certificates: For floor-mounted racks and cabinets, accessories, and components, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions. Base certification on the maximum number of components capable of being mounted in each rack type. Identify components on which certification is based.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: Cabling Installer must have personnel certified by BICSI on staff.

1. Layout Responsibility: Preparation of Shop Drawings will be under the direct supervision of a RCDD.
 2. Installation Supervision: Installation will be under the direct supervision of a Registered Technician who will be present at all times when Work of this Section is performed at Project site.
 3. Field Inspector: Currently registered by BICSI as RCDD to perform the on-site inspection.
 4. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Telecommunications Pathways and Spaces: Comply with TIA-569, most recent edition of the TIA standard.
- C. Grounding: Comply with TIA-607, most recent edition of the TIA standard.

1.6 PROJECT CONDITIONS

- A. Environmental Limitations: Do not deliver or install equipment frames until spaces are enclosed and weather-tight, wet work in spaces is complete and dry, and work above ceilings is complete.

1.7 COORDINATION

- A. Electrical Contractor shall furnish and install the following:
1. Power circuits to telecommunications spaces and equipment.
- B. Unless noted otherwise, the following items will be provided by the Owner:
1. All electronics and active data networking equipment, etc.
 2. Telephones, fax machines and modems, etc.
 - a. Contractor shall coordinate location of electrical receptacles to be installed on raceways, racks or inside cabinets.
 - b. Contractor will be responsible for mounting owner-provided equipment in all architectural walls and ceilings as noted on the Project Documents.

PART 2 - PRODUCTS

2.1 EQUIPMENT AND HARDWARE

- A. Provide all termination hardware, horizontal cable management, accessories, doors, etc., for a complete system installation.

2.2 PATHWAYS

- A. General Requirements: Comply with TIA-569.
- B. Cable Support: NRTL listed, Plenum rated.
- C. Comply with NFPA 70 and UL 2043 for fire-resistant and low-smoke-producing characteristics.
- D. Conduit and Boxes: Comply with requirements in Division 26 Section "Raceway and Boxes for Electrical Systems."

1. Outlet boxes will be no smaller than 4-11/16 "square and 3 inches deep.

2.3 CABLE RUNWAYS

- A. UL Classified and Listed.
- B. Rung Spacing: 12 inches on center.
- C. Furnish and install all connectors and fittings, as required. Where cables drop out of the cable tray, "drop-out" fittings shall be furnished and installed.
- D. Cable tray shall be approved as a ground conductor or ground conductor clamps shall be furnished and installed for each section with appropriate sized ground wire between sections.
- E. Material: Steel.
- F. Finish: Black powder coat
- G. Provide runway waterfalls for all locations where there is a 2' or greater vertical drop from room entrance to horizontal ladder
- H. Provide runway radius drops on rungs over vertical cable managers and where cable exits the side of the runway.
- I. Approved Products:
 1. CPI Cable Runway, Size as indicated on the drawings
 2. No Approved Equal

Where

xx = inches, sized as indicated on drawings

2.4 BACKBOARDS

- A. The Backboards: A/C grade plywood, void free, fire-retardant treated, 3/4 by 48 by 96 inches (19 by 1220 by 2440 mm).
- B. Plywood must be kiln dried to a maximum moisture content of 15 percent.
- C. Must be treated on all sides with at least two coats of fire-resistant, painted flat white.
- D. Comply with requirements for plywood backing panels specified in Division 06 Section "Rough Carpentry".
- E. Mount plywood with fire stamp to room interior. Stamp to be masked during painting and uncovered upon completion.
- F. Provide in close-out submittals Bills Of Lading to prove fire-retardant properties of plywood and paint.
- G. Secure sheets to studs at regular 18" or fewer intervals with screws penetrating into studs a minimum of 3/4".

2.5 CATEGORY 6A PATCH PANELS

- A. Angled Only (Not Flat Panels Allowed)
 - 1. 48 ports (ONLY); 2RU
 - 2. Modular for insertion of jacks to denote color-coded ports
 - 3. Write-on blocks or strip
 - 4. 16-gauge steel with White port numbering on a Black finish
 - 5. Rear lacing bar
 - 6. Category 6A rated

- B. Approved Products:
 - 1. SYSTIMAX 360™ GigaSPEED X10D® 1100GS6 Evolve Angled Category 6A U/UTP Patch Panel, 48 port
 - a. Terminate voice and data circuits on the same patch panels in ascending outlet / jack order

2.6 LC FIBER OPTIC PATCH PANELS/ENCLOSURES

- A. Fiber Termination:
 - 1. Provide LC connectors for fire alarm fiber cabling terminations
 - a. LC connectors are exclusively used for fire alarm systems
 - b. MTP connectors are not allowed under any circumstances
 - 2. Provide SC connectors exclusively for data communications fiber
 - a. 6-strands per connector panel
 - 3. Provide rack-mount termination shelf for data communications backbone cabling
 - a. Provide HD-4U for MDF / BDF locations
 - b. Provide HD-2U for all IDF locations
 - 4. For inside plant, utilize pig tail splicing connectors, and for OSP fiber, utilize fan out kits for termination of the fiber.
 - 5. Adapter plates shall be precision-molded, utilize Zirconia-ceramic ferrules, and color-coded to match fiber type and application.
 - 6. In the B1900A MDF, the fiber will terminate on available slots in an existing 4U patch panel

- B. Approved Products
 - 1. Commscope Systimax HD-2U and HD-4U fiber patch panels, no alternates
 - 2. Provide wall-mount termination panel for fire alarm fiber
 - a. Product: WB2-EMT-BK, no alternates
 - 3. Data fiber (network) terminate fiber on SC connectors (6 strands per connector slot).
 - 4. Fire alarm fiber terminates on LC connectors. (12-strands per connector slot)

2.7 STANDARD RELAY RACKS

- A. All equipment racks and their hardware shall match in appearance and shall be provided by a single manufacturer.
 - 1. Universal hole pattern on the front and rear flanges, and threaded mounting holes on both sides of rack assembly for management
 - 2. Brackets with an eight inch mounting floor plate on the front and rear.
 - 3. Racks will be black in color.
 - 4. Provide 32 spare screws per rack.
 - 5. Horizontal cable support bar on rear of each patch panel/cross connect block panel to support hook and loop (Velcro) strain reliefs. Cables will not rely on terminations for cable support.

6. Hook and loop (Velcro) cable strain relief system on rear of rack to support horizontal and backbone cables. Tie-wraps are specifically prohibited.
7. Hook and loop (Velcro) horizontal and vertical cable management on front of rack for dressing patch cable and cross connect wiring. Tie-wraps are specifically prohibited.
8. Hook and loop (Velcro) cable management system independent of cable management to properly dress the electronic equipment power cords through the rack maintaining as much clearances between the two as possible. Tie-wraps are specifically prohibited.
9. Bonding and grounding cables for all equipment not directly bolted to equipment rack (i.e. shelf mounted electronic equipment, etc.).
10. Surge protected power strip as described in this specification.
11. All hardware, supplementary steel, channel and supports as required properly assembling the rack and supporting it to the building structure.
12. All equipment racks and their hardware will match in appearance and will be provided by a single manufacturer.
 - a. Furnish and install vertical wire management channels on both sides of racks.
 - b. Furnish and install horizontal wire management units, quantity and type as indicated on the drawings.
 - c. Furnish and install ground terminal block/lug for each rack and #6 ground wire to room ground bus bar.

B. Include two each vertical cable managers per standalone rack, or one vertical manager between each rack, and one at each end of a row.

C. Approved Products:

1. CPI Universal 48 RU rack, # 46053-705

2.8 VERTICAL WIRE MANAGERS (VWM)

A. All cable managers and their hardware shall match in appearance and shall be provided by a single manufacturer.

B. Vertical cable managers shall be dual-sided (front and rear), and include doors.

C. Include two each vertical cable managers per standalone rack, or one vertical manager between each rack, and one at each end of a row. Refer to plans for size and location of vertical cable managers.

D. Approved Products:

1. CPI Evolution g2 Double-sided VWM, 12" wide, no alternates

2.9 BRAIDED CABLE SLEEVES

A. Provide braided cable sleeves for cabling in rooms.

B. Polyester expandable sleeving: Flame-retardant and halogen-free.

C. Acceptable Manufacturer:

1. Dell City
2. JDD Tech
3. Approved alternate

2.10 FLOOR PLAN MAPS WITH NUMBERED WORK AREA OUTLETS

- A. Provide a full size plan of floor plan in each telecom room with numbering associated with each work area outlet for that floor or area and mount on TR wall(s).

2.11 PLYWOOD BACKBOARDS

- A. 3/4" grade AC fire retardant plywood required.

2.12 SERVICE LOOPS

- A. Excess cable coiled on wall shall be secured in a cable support ring
- B. Approved products:
 - 1. Leviton Inside Plant Storage Ring, 12", # 48900-IFR
 - 2. Leviton Outside Plant Storage Ring, 24", # 48900-OFR

2.13 ANTI STATIC FLOORS

- A. Flooring may be either tile or epoxy.
- B. Main equipment rooms (data center, server rooms, MPOE, etc.) are to be static dissipative in nature.
- C. Smaller TRs may be anti-static.
- D. Acceptable Manufacturers;
 - 1. Armstrong tile
 - 2. EPF floors
 - 3. Approved alternate

2.14 BUILDING ENTRANCE PROTECTION

- A. For each copper OSP cable that extends beyond the drip line of the building, a single cable entrance protector is required at each end.
 - 1. 100-pair as required by application.
 - 2. Housing and cover constructed of 18 gauge steel, epoxy powder coated.
 - 3. Input terminations shall be 110 type. [Furnish stub length as required. Furnish splice case for stub connected protectors, size as required.]
 - 4. Output terminations shall be 110 type.
- B. Furnish 5 spares per protector.
- C. Approved Products
 - 1. CircaMax 100-pair stub-in protector panel
 - 2. CircaMax protection fuse for data, 300V, with heat coil, v
 - 3. CircaMax protector module for voice, 235V

PART 3 - EXECUTION

3.1 ADDITIONAL INFORMATION

- A. Refer to Section 27 00 00 for the following Part 3 - Execution information

1. General
2. Cable Pathways
3. Work Area Outlets
4. Installation Practices
5. Labeling
6. Firestopping
7. Sealing of Penetrations and Openings
8. Cable Supports
9. Cable Protection
10. Grounding
11. Documentation
12. Training
13. Cleaning
14. Project Closeout

3.2 ENTRANCE FACILITIES

- A. Contact Owner's IT a minimum of one week prior to installation of Entrance Facility hardware and equipment for any instructions they may have for this facility.
- B. Install underground or aerial pathways complying with recommendations in TIA-569, "Entrance Facilities" Article.

3.3 UNDERGROUND ENTRANCE PATHWAY

- A. Install underground entrance pathway complying with Division 26 Section "Raceway and Boxes for Electrical Systems."
- B. Comply with NECA 1.
- C. Comply with BICSI TDMM for layout and installation of communications equipment rooms.
- D. Bundle, lace, and train conductors and cables to terminal points without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

3.4 EQUIPMENT RACKS AND CABINETS

- A. Securely mount equipment cabinet and racks to the building structure.
 1. Proper quantities and supports such as 3/8" lag screws and expansion anchors will be used.
 2. Drywall screws and other types of supports not specifically approved to anchor equipment are specifically prohibited. Submit mounting supports for approval before installation.
- B. Equipment cabinet mounted on or against walls will have 3-foot clearance in front of deepest component.
- C. Patch Panels: Mount patch panels into the cabinet/rack in top-to-bottom fashion with the first patch panel (Fiber) mounted at the top of the "Active" equipment rack. Uniquely label each patch panel according to the numbering convention outlined in the SECTION on labeling. Each port will also have color-coded identifiers. Refer to details on the Drawings.
- D. Cable Management: Secure the cable bundle(s) to the rack strain relief and cable management behind the patch panels and cross connect block panels. Install horizontal

cable management panels and brackets for routing and management of patch cables. Maintain TIA and BICSI standards on bundling, supporting and bend radii.

3.5 SERVICE SLACK LOOPS

- A. Service loops are required for all fiber runs so that they can be relocated or spliced, if necessary.
 - 1. Provide a 20-25 foot service loop at each end of an inter-building fiber cable.
 - 2. Fiber cable slack can be coiled and mounted to backboard using specified storage rings, or on underside of ladder if it does not affect other cabling.
 - 3. Provide 15 feet of service loop for riser cabling at both ends.

3.6 CABLE ROUTING FROM LADDER TO RACKS VERTICAL MANAGERS

- A. In the ER/TR, cables shall be combed and dressed with Velcro ties in a manner as to prevent twists, "braiding" or "divers", and crossed cables in the cable bundle from the telecommunication room entrance to the termination point at the rear of the patch panel. Behind the patch panel, the cable bundle shall be attached to the rear cable support bar, and each cable shall drop out of the bundle in a neat, cascading manner to prevent crossed and/or interwoven cables to each patch panel port termination point.
- B. Neatly dress and manage cable transitions from the ladder with hook-and-loop fasteners.
 - 1. Max Loading Depth:
 - a. 3 inch bundles attached to cable runway.
 - b. Furnish and install vertical cable retaining posts on both sides of all cable drop outs, and along ladders where loading depths exceed 2 inches.
 - c. Confirm appropriate ladder sizing with owner representative for horizontal cabling, backbone cabling, and any rack-to-rack cabling installed by owner, prior to ordering and installing ladder.
 - 1) Increase ladder width if filled with greater than 3" deep cable bundles.
 - 2) Route cable bundles off the ladder such that cables on the 'bottom' are not crushed or kinked regardless of bundle sizes.
 - a) Utilize hook-and-loop fasteners on bundles *and* vertical posts to manage the horizontal to vertical transition regardless of bundle sizes if required to maintain cable integrity (no kinks or crushed cables).
 - b) Black wire "socks" or sleeves are also permitted for cable bundles
- C. Where the distance of cabling entering the room to horizontal cable runway exceeds 18", provide cable support in the form of vertical cable runway that is affixed to wall and to horizontal runway. Where space permits, install cable runway bend radius to effect this transition. Affix cable bundles to runway with hook & loop fasteners.

3.7 BONDING AND GROUNDING

- A. Refer to Section 27 05 26 for Bonding & Grounding requirements.
- B. Install grounding according to BICSI TDMM, "Grounding, Bonding, and Protection".
- C. Comply with TIA-607.
- D. Locate grounding bus bar to minimize the length of bonding conductors.
- E. Fasten to wall allowing at least 2-inch (50-mm) clearance behind the grounding bus bar.

- F. Connect grounding bus bar with a minimum No. 4 AWG grounding electrode conductor from grounding bus bar to suitable electrical building ground.
- G. Bond metallic equipment to the grounding bus bar, using not smaller than No. 6 AWG equipment grounding conductor.
- H. Retain subparagraph below if screened twisted-pair cables and coaxial cables are in communications equipment rooms.
 - 1. Bond the shield of shielded cable to the grounding bus bar in communications rooms and spaces.

3.8 ANTI STATIC AND STATIC DISSIPATIVE FLOORING

- A. Refer to architectural documents for other information
- B. Provide copper bonding conductor for the dissipative flooring that is bonded to telecommunications grounding system.

3.9 BRAIDED CABLE SLEEVES

- A. Provide expandable braided cable sleeves for routing cable bundles from point of entry to racks and cabinets.
- B. Clarify with Owner if color coding of sleeving is required for different device types.

3.10 SEISMIC CONSIDERATIONS

- A. Contractor is responsible to install a fully functional UL Listed system, which when complete, shall be rated for the Seismic Design Category (SDC) in which it is installed, based on the *current* IBC. Coordinate with the architect and structural to verify or determine this parameter
- B. Install all bracing, straps, bolts, etc. to meet this requirement regardless of T series drawings depictions.
- C. Installations or field modifications to installation designs shall be coordinated with a structural engineer.
 - 1. Provide shop drawings that conform to structural engineer's approved attachment and loading requirements.
 - 2. With respect modifications required due to field conditions, coordinate with and receive approval from a licensed structural engineer.
 - 3. Submit for inclusion in the Project Manual structural engineer's approved methods and attachment and loading requirements.

3.11 BACKING

- A. Plywood must be securely fastened to wall framing members to ensure that it can support attached equipment.
 - 1. Affix plywood to all studs a minimum of every 18" with screws that penetrate a minimum of 1" into studs.
 - 2. Screws must be flush with plywood. Countersink if required to meet this requirement.
 - 3. Wall linings will extend from 1' AFF to 9' AFF, with cutouts at electrical outlet locations.
 - 4. These cutouts shall be no larger than the electrical outlet itself.
 - 5. Paint plywood backboards a light color.

6. Cover fire rating stamps before painting so they are clearly visible when painting is complete.
 - B. Proceed with caution so paint does not get on any of the cabling. Any cabling that is painted will need to be completely replaced at the contractor's expense.
 - C. Flush hardware and supports must be used to mount the plywood.
 - D. Install with the A grade surface exposed.
 1. Coordinate with Owner and fire marshal to determine if fire rating must be exposed, or if bill of lading can be presented to validate fire rating of plywood. If this is allowed, place smooth side of plywood to room interior.

END OF SECTION

SECTION 27 1300 - COMMUNICATIONS BACKBONE CABLING

PART 1 - GENERAL

1.1 SUMMARY

- A. This section governs the products and execution requirements relating to furnishing and installing backbone cabling for the communication systems, and supplements requirements found in related sections.
- B. Related Sections:
 - 1. 270000: Communications
 - 2. 270526: Grounding and Bonding of Communication Systems
 - 3. 270810: Optical Fiber Testing and Measurement
 - 4. 270820: Copper Testing
 - 5. 271100: Communications Equipment Room Fittings
 - 6. 271500: Communications Horizontal Cabling
 - 7. 271600: Communications Connecting Cords Devices & Adapters

1.2 PRODUCTS INSTALLED BUT NOT SUPPLIED UNDER THIS SECTION

- A. All conduit and EMT required for Communications cabling pathway in/out of cross connect closets and in/out of wall cavities at the work area. EMT or Conduit for pathways shall have no more than two 90-degree bends and no continuous section over 100'.

1.3 WORK INCLUDED

- A. The Work of this Section shall consist of the labor, materials and equipment required for installing and/or furnishing backbone cabling as part of a complete and operating telecommunications cabling system.
- B. All items specified or included in this section shall be furnished and installed by Telecommunications Contractor, wired and connected by Telecommunications Contractor and tested by Telecommunications Contractor, unless noted otherwise. "Contractor" as used herein shall mean Telecommunications Contractor or Telecommunications Contractor's sub-contractor.

1.4 SUBMITTALS

- A. Submit for approval in accordance with specified submittal procedures.
- B. Prepare submittals for all components of the telecommunications system, as specified herein.

1.5 COORDINATION

- A. Contractor shall furnish and install as required:
 - 1. Inside plant copper backbone cables.
 - 2. Inside plant fiber optic backbone cables.
 - 3. Outside plant copper backbone cables
 - 4. Outside plant fiber optic backbone cables
- B. Electrical Contractor shall furnish and install the following:
 - 1. Telecommunications raceways within the building.
 - 2. Telecommunications duct banks, hand-holes and manholes.

PART 2 - PRODUCTS

2.1 FIBER OPTIC CABLES

- A. Cable may be either of composite cable construction or standard cable containing single-mode fibers in one cable sheath and multi-mode fibers in a separate cable sheath. Contractor shall verify raceway fill requirements when furnishing and installing two standard cable constructions to meet composite strand count requirements.
- B. Fiber Optic Cable Shipping Requirements
1. All cabled optical fibers > 1000 meters in length shall be 100% attenuation tested. The attenuation of each fiber shall be provided with each cable reel.
 2. Top and bottom ends of the cable shall be available for testing on the shipping reel.
 3. Both ends of the cable shall be sealed to prevent the ingress of moisture.
 4. Each reel shall have a weather resistant reel tag attached identifying the reel and cable. The reel tag shall include the following information:
 - a. Cable Number, Gross Weight
 - b. Shipped Cable Length in Meters, Job Order Number
 - c. Manufacturer Product Number, Customer Order Number
 - d. Date Cable was Tested, Manufacturer Order Number
 - e. Cable Length Markings, Item Number
 - 1) Top (inside end of cable)
 - 2) Bottom (outside end of cable)
- C. Each cable shall be accompanied by a cable data sheet. The cable data sheet shall include the following information:
1. Manufacturer Cable Number, Manufacturer Product Number
 2. Manufacturer Factory Order Number, Customer Name
 3. Customer Purchase Order Number
 4. Mark for Information Ordered Length
 5. Maximum Billable Length, Actual Shipped Length
 6. Measured Attenuation of Each Fiber Bandwidth Specification (for lengths > 1000 m)
- D. The cable manufacturer shall provide installation procedures and technical support concerning the items contained in this specification.
- E. Acceptable Manufacturer: Commscope Teraspeed, no alternates
1. Cable may be either of composite cable construction or standard cable containing single-mode fibers in one cable sheath and multi-mode fibers in a separate cable sheath. Contractor shall verify raceway fill requirements when furnishing and installing two s
 2. Standard cable constructions to meet composite strand count requirements.
 3. Fiber Cable - Outside Plant
 - a. Cable Construction:
 - 1) Loose tube, up to 12 fibers per tube.
 - 2) Dry water-blocking tape.
 - 3) Fillers as required by strand count and cable construction.
 - 4) Epoxy glass central strength member.
 - 5) Reverse oscillation stranded buffer tubes.
 - b. Jacket Material: Medium density polyethylene
 - c. Fiber Count: As indicated on Drawings.
 - d. Fiber Type:
 - 1) Single-mode: 8.2/125.
 - e. Color coded 250-micron coated fibers.
 - f. Color code: TIA/EIA-598-A, Optical Fiber Cable Color Coding.
 - g. Jacket Color: Black

- h. Maximum Pulling Tension: 2700 N (600 lb/f) during installation, 890 N (200 lb/f) installed
 - i. Storage Temperature: -40 to +70 degrees C (-40 to +158 degrees F).
 - j. Installation Temperature: -30 to +60 degrees C (-22 to +140 degrees F).
 - k. Operating Temperature: -40 to +70 degrees C (-40 to +158 degrees F).
- 4. Fiber Cable – Inside Plant, Riser
 - a. Cable Construction:
 - 1) Distribution type.
 - 2) Individually jacketed bundles for strand counts greater than 24.
 - 3) Central Strength Member:
 - a) Up to 24 strand: Aramid yarn.
 - b) Greater than 24-strand: Flexible glass/epoxy rod.
 - b. Jacket Material: Fire retardant PVC, OFNR rated.
 - c. Fiber Count: As indicated on Drawings.
 - d. Fiber Type:
 - 1) Single-mode: 8.2/125.
 - e. 900 micron tight buffered fibers.
 - f. Color Code: TIA/EIA-598-A, Optical Fiber Cable Color Coding.
 - g. Jacket Color: Yellow
 - h. Maximum Pulling Tension:
 - 1) Up to 12 strand: 660 N (148 lb/f) during installation, 198 N (45 lb/f) installed.
 - 2) 18 strand and above: 1320 N (297 lb/f) during installation, 396 N (89 lb/f) installed.
 - i. Storage Temperature: -40 to +70 degrees C (-40 to +158 degrees F).
 - j. Installation Temperature: -10 to +60 degrees C (+14 to +140 degrees F).
 - k. Operating Temperature: -20 to +70 degrees C (-4 to +158 degrees F).
- 5. Optical Fiber Performance Requirements (OSP and ISP fiber cables) Glass Transmission Media - Single Mode
 - a. Acceptable Manufacturer: CommScope TERASPEED OS2, no alternates
 - b. Dispersion unshifted, low water peak.
 - c. Proof tested to 100 kpsi
 - d. Cable cutoff wave length <1260 nm.
 - e. Glass Geometry:
 - 1) Fibercurl: > 4.0mm radius of curvature.
 - 2) Cladding Diameter: 125.0 ± 0.7 µm
 - 3) Core: Clad Concentricity: - < 0.50 µm
 - 4) Cladding Non Circularity: < 1.0%.
 - f. Cabled Fiber Optical Performance:
 - 1) 1310 nm: - < 0.4 dB/Km, maximum
 - 2) 1383 nm: ± 3 nm ≤ 22 dB/Km
 - 3) 1550 nm: < 0.20 dB/Km, maximum
 - 4) Zero Dispersion Wave Length: 1302 ≤ wavelength ≤ 1322
 - 5) Zero Dispersion Slope: 0.086 psi/(nm.km)
 - 6) Refractive Index Difference: 0.36%
 - 7) Numerical Aperture: 0.14
 - 8) In compliance with TIA/EIA 492-CAAB and Telecordia's GR-20.
 - 9) Enhanced water peak at 1383 nm.
- 6. Fiber Optic Cable Shipping Requirements
 - a. All cabled optical fibers > 1000 meters in length shall be 100% attenuation tested. The attenuation of each fiber shall be provided with each cable reel.
 - b. Top and bottom ends of the cable shall be available for testing on the shipping reel.
 - c. Both ends of the cable shall be sealed to prevent the ingress of moisture.
 - d. Each reel shall have a weather resistant reel tag attached identifying the reel and cable. The reel tag shall include the following information:
 - 1) Cable Number, Gross Weight
 - 2) Shipped Cable Length in Meters, Job Order Number

- 3) Manufacturer Product Number, Customer Order Number
- 4) Date Cable was Tested, Manufacturer Order Number
- 5) Cable Length Markings, Item Number
 - a) Top (inside end of cable)
 - b) Bottom (outside end of cable)
- e. Each cable shall be accompanied by a cable data sheet. The cable data sheet shall include the following information:
 - 1) Manufacturer Cable Number, Manufacturer Product Number
 - 2) Manufacturer Factory Order Number, Customer Name
 - 3) Customer Purchase Order Number
 - 4) Mark for Information Ordered Length
 - 5) Maximum Billable Length, Actual Shipped Length
 - 6) Measured Attenuation of Each Fiber Bandwidth Specification (for lengths > 1000 m)
- f. The cable manufacturer shall provide installation procedures and technical support concerning the items contained in this specification.

2.2 FIRE ALARM OPTICAL FIBER MULTIMODE CABLE

A. Manufacturers:

1. CommScope
2. No Alternates

B. Fiber Type:

1. Multimode, graded-index
2. Core/Cladding Diameter: 62.5/125 μm
3. Classification: OM1
4. Strand Count: 12-fiber
5. Construction: Tight-buffered, distribution-style or breakout-style depending on application
6. Jacket Rating:
 - a. Riser-rated (OFNR) or
 - b. Plenum-rated (OFNP) as required by site conditions and code compliance

C. Optical Performance Requirements:

1. Wavelengths:
 - a. 850 nm
 - b. 1300 nm
2. Attenuation (maximum):
 - a. 3.5 dB/km @ 850 nm
 - b. 1.0 dB/km @ 1300 nm
3. Bandwidth:
 - a. 200 MHz·km @ 850 nm
 - b. 500 MHz·km @ 1300 nm

D. Mechanical Performance:

1. Minimum bend radius (installation): per manufacturer's recommendation
2. Tensile strength (installation): 600 N (typical)
3. Crush resistance: 220 N/cm (minimum)

Markings and Identification:

1. Cable jacket shall be red and labeled "FIRE ALARM – FIBER OPTIC CABLE" at intervals not exceeding 3 feet.
2. Include sequential length marking.
3. Jacket shall be clearly labeled with manufacturer name, part number, fiber type, and UL listing.

E. Compliance and Standards:

1. ANSI/TIA-568.3-D
2. ANSI/TIA-598-D (color coding)
3. NFPA 70 (NEC), Article 770
4. NFPA 72 (National Fire Alarm and Signaling Code)
5. UL 1651 (for optical fiber cables)
6. Local AHJ requirements

2.3 COPPER OSP CABLE (BACKBONE CABLE)

- A. Cables should be specifically PE89, gel filled, qualpeth sheathed with aluminum shield, 22 AWG, multi-pair cables.
- B. See one line diagram in the drawings for required pair counts.
- C. Minimum performance specifications: The cables shall meet the requirements of ANSI/EIA/TIA-568B for 100- Ohm UTP Multi-pair Backbone Cable.
- D. Non-hygroscopic core wrap.
- E. The insulation of the tip conductor shall be marked with a stripe of the mating ring insulation color.
- F. Manufacturer/Product: Superior Essex Sealpic-FSF RDUP PE.89 Part#: 09-069-02-xx (xx = pair count)
- G. Multi-pair Cable - Inside Plant Riser, Category 3
 1. Acceptable Manufacturer:
 - a. Systemax,/Commscope
 - b. Approved equal.
 2. Cable type: Category 3 – CMR – Polyolefin or CMP – Low smoke fire retardant FEP.
 3. Jacket Markings: Manufacturer's identification, pair count, wire AWG, sequential footage.
 4. Conductors: Solid 24 AWG copper
 5. Twisted pairs with varying lay lengths, quantity of pairs as indicated on Drawings.
 6. Conductor Insulation:
 7. Industry standard color coding, with colored binder tape for cable sizes greater than 25-pair.
 8. Jacket Color: Grey
 9. Electrical Characteristics: Meets TIA/EIA-568B requirements for Category 3 rated cables.
 10. CMR rated cable for installation in vertical risers and conduit
 11. CMP rated cable for installation in plenum air spaces

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General

1. All cable and associated hardware shall be placed so as to make efficient use of available space in coordination with other uses. All cable and associated hardware shall be placed so as to not impair the use or capacity of other building systems, equipment, or hardware placed by others (or existing).
2. Where cable is placed in ceiling areas or other non-exposed areas, cables shall be installed in cable trays or in non-continuous cable support system. Non-continuous cable supports shall be placed at random intervals no greater than 48 inches. Cables in non-continuous support systems shall be bundled using hook and loop type fasteners. Cable sag between supports shall not exceed 3 inches. Attaching wire to pipes or other mechanical items is not permitted. Cables shall not be bundled or tied in conduits, and in cable trays above ceilings.
3. All cabling shall be routed so as to avoid interference with any other service or system, operation, or maintenance purposes such as access boxes, network equipment, mechanical equipment access doors and covers, switches or electrical panels, and lighting fixtures. Avoid crossing areas horizontally just above or below any riser conduit. Lay and dress cables to allow other cables to enter the conduit/riser at a later time by maintaining a working distance from these openings. All cable shall be installed to allow for simple installation and removal of cables in the future.
4. Unless noted, all interior wiring shall be installed in raceways. Wiring above accessible ceilings may be installed in cable tray and exposed on "J" hooks.
5. All cables not in raceways shall be riser or plenum rated.
6. All cables running outside the building shall be rated for outside plant installation.
7. Backbone cables shall be grouped separately from horizontal distribution cables. Cable for other systems shall be grouped separately from cables for telephone and data.
8. All inside cable shall be installed neatly above accessible ceilings using cable tray and "J" hooks supported from building structure. Do not attach to pipes, conduits, ducts, etc. Do not allow cable to rest on pipes, conduits, ducts, ceiling tiles, etc. Do not attach to wires used for supporting suspended ceilings. Do not use tie wires or bridle rings.
9. All wires shall be marked at all junction boxes, pull boxes, cabinets, boxes and terminations. Each cable run between terminating locations shall be one continuous cable (no splices or connections).
10. The Contractor shall install cable in such a manner as to prevent stretching, kinking or sharp bends. Cable damaged during installation or not passing required testing shall be removed and replaced at no additional cost to Owner.
11. The Contractor shall replace or rework cables showing evidence of improper handling including stretches, kinks, short radius bends, over tightened bindings, loosely twisted and over twisted pairs at terminations, and too much jacket removed.
12. Minimum bend radius and maximum pulling tension for all cables shall be maintained during and after installation. Install cable in accordance with manufacturer's ratings and instructions.
13. Cables shall not be installed near power sources or other items where interference could develop. Cables shall not be placed within 18 inches of light fixtures and within 3 feet of motors, transformers, copy machines, or solid state motor starters unless cable is installed in conduit. Contractor shall furnish and install a grounding conduit system where these minimum clearances cannot be maintained.
14. In telecommunications spaces, cables shall be routed as close as possible to the ceiling, floor, or corners to ensure that adequate wall or backboard space is available for current and future equipment and for cable terminations. Cables shall not be tie-wrapped to existing electrical conduit or other equipment. Minimum bend radius shall be observed.
15. Dress and attach cables to the backboard along the shortest possible route run square (horizontal and vertical) to the backboard. Bundle similarly routed cables together and attach by means of clamps or distribution rings. Cable dress and attachment shall minimize obstruction to future installations of equipment, backboard, or other cables.
16. Cables shall be neatly bundled with hook and loop type fasteners. Nylon tie wraps are not acceptable. Cables must be neatly bundled in the telecommunications spaces and at the cable service loop.

17. A break-away link shall be used for installation of cables with a cable-puller or winch. The break-away link shall be designed to separate at or below the recommended maximum tension of the cable being installed.
18. Any damage to Owner's existing cabling or existing cable owned by others, caused as a result of work performed under this scope, shall be brought to the Owner's attention and repaired or replaced within 48 hours.
19. Contractor shall use only cable lubricants recommended by the manufacturer for use with the specific cable construction.
20. Should a cable become kinked, skinned or stretched during installation, the cable shall be removed and replaced at no additional cost to the Owner. Splicing at points other than those specified will not be acceptable.

B. Outside Plant Cable

- a. Extend cabling as required to ultimately terminate in cabinets via tie cables from the wall.

3.2 CONDUITS AND CABLING

- A. Coordinate with electrical contractor to provide conduit pathways for cabling that would otherwise be 'buried' in walls or above ceilings.
- B. All cabling must be permanently accessible, either directly, or via conduits.

END OF SECTION 27 13 00

SECTION 27 1500 - COMMUNICATIONS HORIZONTAL CABLING

PART 1 - GENERAL

1.1 SUMMARY

- A. This section includes information on horizontal communications cabling supplementing requirements found in the related sections.
- B. Related Sections
 - 1. 270000: Communications
 - 2. 270820: Copper Testing
 - 3. 271300: Communications Backbone Cabling
 - 4. 271600: Communications Connecting Cords Devices & Adapters

1.2 PRODUCTS INSTALLED BUT NOT SUPPLIED UNDER THIS SECTION

- A. Conduit and EMT required for Communications cabling pathway in/out of cross connect closets and in/out of wall cavities at the work area where ceiling is inaccessible.
- B. Rings (and strings) with conduit connecting tabs for the mounting of NEMA rated faceplates where required.
- C. Drag line or pull string at the ring fished through EMT or conduit to the other end for installing 4 pair and multi-pair cables.

1.3 WORK INCLUDED

- A. The work included under this Specification consists of furnishing all labor, equipment, materials, supplies and performing all operations necessary to complete the installation. The Contractor will provide and install all the required material whether specifically addressed in the Specification or not.

1.4 SYSTEMS DESCRIPTION

- A. Horizontal copper cabling system consists of rated cables with four unshielded twisted pairs of solid annealed copper wrapped in plenum rated insulation with an overall plenum rated jacket with a wire thickness of 23 AWG. Each four-pair cable is terminated onto 8 position 8-conductor rated connectors using 110 style IDCs. Connectors are placed into NEMA rated faceplates at the work area and placed into rack mounted patching panels in the equipment / networking rooms.
- B. Horizontal cable and its connecting hardware provide the means of transporting signals between the telecommunications outlet/connector and the horizontal cross-connect located in the communications equipment room. This cabling and its connecting hardware are called "permanent link," a term that is used in the testing protocols.
 - 1. TIA-568 requires that a minimum of two telecommunications outlet/connectors be installed for each work area.
 - 2. Horizontal cabling will contain no more than one transition point or consolidation point between the horizontal cross-connect and the telecommunications outlet/connector.
 - 3. Bridged taps and splices will not be installed in the horizontal cabling.
 - a. A work area includes the components that extend from the telecommunications outlet/connectors to the station equipment.

- b. The maximum allowable horizontal cable length is 250 feet. This maximum allowable length does not include an allowance for the length of 16 feet (4.9 m) to the workstation equipment. The maximum allowable length does not include an allowance for the length of 18 feet in the horizontal cross-connect.

1.5 MANUFACTURER QUALIFICATIONS

- A. Manufacturer shall be a telecommunications product manufacturer with at least 20 years of experience.
- B. Manufacturer shall be ISO 9001 certified manufacturer and shall employ Six Sigma methodology in its manufacturing process.
- C. Where a specific manufacturer is called out by name, this is the preferred standard. If substitutions are allowed, they are at the discretion of the Owner and based on performance, suitability, quality, administrative requirements, warranty and other factors deemed important to the Owner.

1.6 TESTING AGENCY QUALIFICATIONS

- A. Independent testing agencies shall be nationally recognized as having the expertise to independently verify copper and optical fiber cabling systems and components.
- B. Testing Agency Qualifications: Must be a NRTL.
 - 1. Testing Agency's Field Supervisor: Currently certified by BICSI as an RCDD to supervise on-site testing.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- D. Telecommunications Pathways and Spaces: Comply with TIA-569.
- E. Grounding: Comply with TIA-607.

1.7 WARRANTY

- A. Contractor shall provide a 1 year parts and labor warranty against defective workmanship and/or system component failure in addition to the CommScope SYSTIMAX complete cabling system warranty.
- B. Contractor shall execute a Limited Lifetime Product & Performance Warranty covering all components, equipment and workmanship which shall be provided to the Owner, submitted in writing with system documentation. The warranty period shall begin on the system's first use by the owner.
- C. Horizontal channels shall be completed with end to end solutions, with the Commscope Systimax Solution. No alternative solutions are acceptable on the project. Factory-terminated copper and/or fiber optic patch cords from the solutions provider must be used in order to be eligible for the applicable channel performance guarantees.
- D. As further described below, the "Supplier" shall warrant to the customer ("Buyer") that certified network installations will exceed the defined TIA-568 series industry specifications in force at the time of product purchase. Furthermore, the products that comprise the certified Cabling

System will meet or exceed the applicable product performance specifications in effect at the time of manufacture.

- E. This warranty covers the copper and fiber optic permanent links of the network as defined by TIA-568 which includes the cable and connecting hardware. This warranty will be extended to include the entire channel provided that the applicable patch cords and equipment cords are utilized, and all products are installed within areas protected from outside elements.

PART 2 - PRODUCTS

2.1 GENERAL

- A. The Electrical Code referred to in these specifications is the National Electrical Code as currently adopted by the State of California. All work will be provided in strict compliance with the Electrical Code and all regulations that may apply.
- B. Where standards exist, for a particular category, products used on this project will be listed by an OSHA approved Nationally Recognized Testing Laboratory (NRTL) and be approved or listed for the intended service and application.
- C. These specifications do not undertake to repeat the requirements of codes, regulations or NRTL listing or labeling instructions. The Specifications or Drawings may require items or work beyond the requirements of applicable codes or regulations. The stricter, higher quality, greater quantity or higher cost will be provided. It is incumbent on the Installer, material and equipment suppliers to meet these specifications, applicable codes, regulations, and NRTL listing agency restrictions.

2.2 MANUFACTURER

- A. The word "Manufacturer" will include the Manufacturer, the Manufacturer's Representative, the Distributor, the Fabricator, and the Supplier of the particular classification of equipment, system, product, and material.
- B. All work, equipment, and systems will be manufactured, provided, repaired, installed, and tested in accordance with the latest edition and all current amendments of the applicable publications and standards of the organizations listed below as of the date of the Contract Documents. When the Specification requirements exceed the requirements of these publications and standards the Specifications will govern:
 1. State Building Code (SBC)
 2. Building Department Inspectional Services
 3. American Society for Testing and Materials (ASTM)
 4. Underwriter's Laboratories, Inc. (UL)
 5. Insulated Cable Engineers Association (ICEA)
 6. National Electrical Manufacturers Association (NEMA)
 7. Institute of Electrical and Electronics Engineers, Inc. (IEEE)
 8. American National Standards Institute, Inc. (ANSI)
 9. National Fire Protection Association (NFPA)
 10. Local Electric Code
 11. Department of Public Safety (DPS)
 12. Building Officials and Code Administrators International, Inc. (BOCA)
 13. Department of Labor USA. Safety and Health Regulations for Construction (OSHA)
 14. Energy Codes
 15. National Electrical Contractors Association (NECA)

16. National Bureau of Standards (NBS)
17. Federal Communications Commission (FCC)
18. Utilities Serving Project.
19. Fire Department.
20. Americans with Disabilities Act Applications Guidelines (ADAAG).
21. Accessibility Guidelines for Buildings and Facilities.
22. Any and all Federal, State and Local Standards, Codes and Authorities having Jurisdiction.
23. In addition, all phases of the Structured Cabling System installation will adhere to applicable Local Area Network (LAN) Specifications of the Institute of Electrical and Electronics Engineers (IEEE), Electronics Industry Association/Telecommunications Industry Association (TIA/EIA), American National Standards Institute (ANSI), and Building Industry Consulting Service International (BICSI). The entire system and all components will be NRTL certified to appropriate TIA/EIA performance rating Category, Latest TIA Standards 455, 492.CAAAB, 492.AAAC, 492.AAAD, 568, and (SP-4195-B and SP-4195-B-1), 569, 570, 606, 607 and 758 (latest revisions), TIA/EIA TSB 67, TSB 72, TSB 75, TSB 95 and other standards as applicable.

- C. The Installer will have available at the job site at all times one copy of the latest edition of the Electrical Code, TIA and BICSI Standards applicable to the work as specified within this document.
- D. The above requirements will not in any way limit responsibility or requirements to comply with all other codes, standards and laws.
- E. Material, equipment, enclosures, and systems will be designed for use as required to suit the conditions, exterior or interior operation, dust tight, water tight, explosion-proof, or other special types.

2.3 APPROVED PRODUCTS

- A. Approved Connectivity Manufacturer Basis of Design
 1. CommScope Systimax Category 6A UTP cabling solution, 2091B
 - a. No Alternates

2.4 UTP PIN/PAIR TERMINATION ASSIGNMENT

- A. The UTP cabling systems will have TIA/EIA T568B pin/pair termination assignment. All conductors provided will be properly and consistently terminated at both ends throughout the entire systems. Maintain proper untwist of pairs and removal of jacket per TIA and BICSI.

2.5 SYSTEM PERFORMANCE

- A. Horizontal four pair Category 6A copper cabling system shall be capable of supporting 10G Base-T applications for a total distance of 100 meters with equipment cords.
- B. System shall provide "future proof" channel performance and guaranteed margins as noted in this document and is guaranteed to exceed TIA-568 Category specifications for Insertion Loss, NEXT, PSNEXT, ACR, PSACR, ELFEXT, PSELFEXT and Return Losses to 500 MHz for Category 6A. The system is also guaranteed 10 dB PSACR headroom for 6A cabling.

2.6 SYSTEM PERFORMANCE

- A. CAT6A Unshielded (U/UTP, or UTP) Systems

1. Horizontal UTP Category 6A 23AWG copper cabling system shall be guaranteed to exceed all TIA-568 link and channel performance requirements and be capable of supporting 10G Base-T (802.3an) and ISO/IEC 11801 Class EA applications for a total distance of 100 meters with equipment cords. System is guaranteed to meet all Cat 6A requirements for short links and channels down to a 10-foot link (5 meter channel) with a guaranteed 4 dB margin of Alien Crosstalk. Field testing is not required for Alien Crosstalk clearance.
2. Basis of Design is Commscope Systimax Category 6A UTP Cabling Solution
3. CAT6A Performance Parameters, headroom over TIA-568 standard:

Insertion Loss	NEXT	PSNEXT	ACR-F (ELFEXT)	PSACR-F (PSELFEXT)	Return Loss	ACR-N	PSACR-N	PSANEXT	PSAACR-F
3%	5 dB	6 dB	10 dB	10 dB	4 dB	7 dB	7 dB	5 dB	11 dB

2.7 SOURCE QUALITY CONTROL

- A. All materials shall be purchased from Distributors authorized by system Manufacturers to sell new and unused components.

2.8 CATEGORY JACKS

- A. Provide CAT6A rated jacks, cables and patch cord where noted on the design documents.
- B. Communications Faceplate ports shall contain Category jacks which are matched to cable. Jacks shall be terminated to the Horizontal Cabling and inserted into the Communications Faceplate.
- C. Connection Reliability
 1. Use connectors with 50 micro-inches of gold-plated tines (as specified by TIA standards), as well as designs that offset or increase the distance between the connection point of the connector tines and the plug contact point during removal, preventing arc damage.
 2. Connectors should also meet contact resistance requirements found in the IEC 60512-99-001 standard covering connectors for electronic equipment.
- D. CATEGORY 6A JACKS
 1. Provide modular type Category 6A information outlets for 23-AWG copper cable. These Category 6A (CAT6A) connectors shall be individual snap-in style and exceed compliance with TIA/EIA-568-C.2 specifications.
 - a. The jacks shall be CommScope SYSTIMAX MGS600 jacks, No Alternates
 - b. The Jacks shall be white in color for voice circuits and blue in color for data circuits

2.9 UTP CABLE

A. NETWORK DATA CABLES

1. Provide 4-pair, 100-Ohm balanced unshielded twisted pair (UTP) Plenum-rated (CMP) Cables for each data outlet designated.
2. Cable jacketing:
 - a. Shall be Blue for DATA.
 - b. Shall be White for Voice circuits.

3. Cable shall be independently verified for flammability by UL and listed under file number E138034 and shall comply with NEC article 800, NFPA 70, and CMP (NFPA 262, UL 910).
 4. Copper clad aluminum cables are not permitted. Installation of such will be cause for the necessity of removing the cabling and the installation of copper cables at the contractor's expense.
 - a. Any costs associated with project delays caused by the installation of these cables and the removal and installation of acceptable cables will be borne by the contractor.
 5. Terminate all outdoor cables or transition to plenum rated indoor cabling within 50 feet of conduit termination in building.
- B. CAT6A UTP cable shall conform to the following requirements:
1. CAT6A Unshielded twisted-pair cable (U/UTP, or UTP)
 2. 100-Ohm, 23 AWG, CAT 6A 4-pair balanced unshielded twisted pair solid annealed copper
 3. Cable shall be characterized to 750 MHz and UL/ETL Listed by the Manufacturer printed on the cable jacket and package, as well as ETL Verified to TIA-568 Category 6A and ISO/IEC 11801 Class E_A requirements for channel, link and component performance to support IEEE 10GBASE-T (802.3an) networks
 4. Maximum CMP Cable Outer Diameter: 0.275".
 5. Documentation available from an independent third-party testing agency that verifies through random sampling that cable components perform at or above the levels contained on their product specifications, not simply at or above the standard.
 6. Guaranteed cable balance improves overall performance and reduces emissions which results in error-free performance up to 10 Gigabit Ethernet with full duplex transmission
 7. Provided on spools to reduce risk of kinking cable upon deployment
 - ~~8.~~ Cable shall be Plenum-rated CMP
 9. Be made by an ISO 9001 and 14001 Certified Manufacturer.
 10. Meet or exceed Channel margin guarantees as stated above under System Performance
 11. Approved Products:
 - a. Commscope Systimax GigaSPEED

2.10 OUTLET MOUNTING

- A. WALLPLATES
1. Wall plates (or "faceplates") provide information outlets to the work area. Contractor shall provide and install single gang faceplate kits to allow up to four data or voice jacks as required for all work area outlets, workstation base feeds, and unused telecom backboxes and furniture openings (a maximum of four outlets are allowed in any installed faceplate in the project). Faceplates shall:
 - a. Utilize a Quickport footprint to match the approved connectivity manufacturer, and be made by the same manufacturer as the connectors.
 - b. Match colors and materials of the power wiring device plates.
 - c. Support any connectivity media type, including fiber and copper applications.
 - d. Have write-on designation labels for circuit identification together with a clear plastic cover.
 - e. Be available in single-gang and double-gang configurations.
 - f. Have surface-mount boxes and standoff rings available for both single and double gang faceplates.
 - g. Have single-port matching color blank inserts available in packs of 10.
 - h. Approved Products:
 - 1) CommScope M14L plates

Where:

= number of ports: 1, 2, 3, 4. Wall plates beyond quantity of four are not permitted.

x = color: White (W), Ivory (I), Light Almond (T), Gray (G), Black (E)

B. SURFACE-MOUNT BLOCKS (SMB)

1. Surface-Mount Blocks (SMBs) are used to protect terminated CAT6A cables at the endpoints where they are not contained within walls or furniture. Example locations may be Wireless Access Points (WAPs), Group Work Areas fed by conduits run down columns, security cameras, or other network-enabled device locations.
2. Ceiling, WAP, Camera and other non-wall-mount locations will use a 2-port plastic SMB.
3. Small Surface-Mount Boxes shall exhibit the following characteristics:
4. Outlet housings for WAPs and other devices shall be a high-density, low profile design with (2) or (4) field-configurable ports, snap-lock cover, and cable knockouts on back.
5. Housing cover shall have raceway knockouts for top and bottom entry. Base shall include Tie-wrap anchor points at all cable entrances.
6. The housing shall be mountable with screws, tape or a single magnet.
7. The cover shall provide the option of securing it to the base with a screw that is hidden under the outlet identification window.
8. Shall be constructed of a Plenum-rated, high-impact self-extinguishing plastic rated UL 94V-0, and be UL Listed and compliant with FCC Part 68 and TIA-568 specifications.
9. Approved Products:
 - a. Commscope Systemax
 - b. No Alternates

2.11 CABLE SUPPORTS

A. J-HOOKS

1. Support all cable above ceiling on dedicated cable support hardware a minimum of 6" above accessible ceilings. 50 cables maximum are allowed on a single run of J-Hooks. Provide addition J-Hook runs for cable quantities exceeding 50.
2. Provide cable saddles and J-hooks where cable tray or wire basket is not available. These must be supported on their own ceiling wires, threaded rod, or affixed to building structure by use of beam clamps (on metal beams) or wood screws (on wood beams). Affixing communication cable supports to existing ceiling support wires is not allowed.
3. Approved Products:
 - a. B-Line Cable Hook, BCHxx
 - b. B-Line Cable Hook, Cable to Beam Fastener, BCHxx-C2
 - c. B-Line Cable Hook, Cable to Fastener, 2", BCHxx-C442
 - d. B-Line Cable Hook, Cable to Rod Fastener, 2", BCHxx-W2

Where:

xx = 21 (1.25"), 32 (2"), or 64 (4")

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Refer to section 27 00 00
- B. All installation shall be done in conformance with TIA-568 standards, BICSI methods, industry standards and manufacturer's installation guidelines. The Contractor shall ensure that the maximum pulling tensions of the specified distribution cables are not exceeded and cable

bends maintain the proper radius during the placement of the facilities. Failure to follow the appropriate guidelines shall require the Contractor to provide in a timely fashion the additional material and labor necessary to properly rectify the situation. This shall also apply to any and all damages sustained to the cables by the Contractor during the implementation.

- C. Cabling between communications rooms and workstation locations are to be installed as individual "home runs". No intermediate punch down blocks or splices may be installed or utilized between the communications rooms and the information outlets at the workstation location.
- D. All cable must be handled with care during installation so as not to change performance specifications. Factory twists of each individual pair must be maintained up to the connection points at both ends of the cable. There shall never be more than .5 inches of unsheathed Category 6A UTP cable at either the wiring closet or the workstation termination locations.
- E. All cabling and associated hardware shall be placed so as to make efficient use of available space. All cabling and associated hardware shall be placed so as not to impair equipment's efficient use of their full capacity.
- F. EMT or Conduit for pathways shall have no more than two 90-degree bends and no continuous section over 100'. Each conduit opening will be fitted with a nylon bushing to prevent damage to cables.
 - 1. Add hinged pull boxes to meet this requirement
- G. Provide cable tray to support main pathway cable bundles.
 - 1. Utilize J-Hooks as shown on drawing details to final device location.
- H. Exposed Cable
 - 1. All station cabling shall be installed inside walls or ceiling spaces whenever possible.
 - 2. Exposed station cable will only be run where indicated on the drawings and will only be allowed when no other options exist. Owner must approve all exceptions.
- I. Coordinate with other trades on whether there is a presence of variable frequency drive motors (VFD) being used above ceilings or at any location in the building, and if so, where their locations are.
 - 1. Route cabling away from VFD motors, maintaining a minimum of 6 feet from the motors.
- J. All cabling placed above drop ceilings must be supported by cable tray, conduit, or J-Hooks.
 - 1. Permanently affix cable supports to the building structure or substrates and provide attachment hardware and anchors designed for the structure to which attached and are suitably sized to sustain the weight of the cables to be supported.
 - 2. Attaching cable to pipes or other mechanical items is not permitted.
 - 3. Communication cables shall be routed so as to provide a minimum of 18 inches spacing whenever possible from light fixtures, sources of heat and EMI sources.
 - 4. Cabling shall not be attached to ceiling grid wires. Multiple cables are to be dressed every 4 feet.
 - 5. Support Cables on cable tray or J-hooks a minimum of every 4-feet
 - 6. Maximum cable sag between cable hooks is 3"-6".
 - 7. Plastic/nylon tie-wraps are not allowed to permanently secure cables inside the Telecommunications Rooms.
 - 8. All cabling installed above drop ceilings shall be installed a MAXIMUM of 12" above the finished ceiling

- K. Provide shall provide a 24-inch service loop above the access ceiling or cable trays unless specified otherwise. All service loops shall be 24 inches in diameter and be accessible for maintenance.
1. Coordinate loop placement and orientation with the technology consultant. This allows for future changes or expansion without installing new cables.
- L. Install cabling in cable trays and J-hooks by function and type of circuit.
1. Loosely lay cable in trays, segregating cable types. Do not use Velcro or cable ties to bundle cables.
 2. Only telecom cabling shall be installed in cable trays. No other low-voltage cabling is allowed within the cable tray.
- M. Identification:
1. Label cable terminations on designation strips.
 2. Label all cable at each terminating point.
 3. Label each port of the work area outlet.
 4. Cable identification numbers shall not be duplicated.
 5. Labeling convention to be coordinated with Owner.
 6. Label data patch panels and voice blocks in the communications rooms to match those on the corresponding voice and data outlets. The font shall be at least .125-inch in height.
 7. Where a wireless access point is installed above an acoustical ceiling, label the ceiling grid frame below the access point, displaying the data port number and, if applicable, the access point identification number. Coordinate with the Owner for all access point identification information.
 8. All labels shall correspond to as-built drawings and to final test reports.
 9. Coordinate with Owner for specifications on labeling of all hardware, cabling, and related equipment prior to any testing.
 10. Label each distribution rack, block and other terminating equipment unit and field within that unit within 4 inches from the block or patch panel termination. Keep labels in a neat and orderly lineup.
 11. Label each connector and each discrete unit of cable-terminating and connecting hardware within connector fields, in wiring closets and equipment rooms. Where similar jacks and plugs are used for both communication and data-processing equipment, use a different color for jacks and plugs of each service.
 12. Post the cable schedule in a prominent location in each wiring closet and equipment room. List incoming and outgoing cables and their designations, origins, and destinations.
 13. Provide electronic copy of final comprehensive schedules for project in software and format selected by Owner.
 14. Refer to the following drawing for faceplate labeling:
 15. All cable labels shall:
 - a. Be marked at each end, on the sheath indicating the Telecommunications Room and jack number to which the cable is wired.
 - b. Backbone cables shall be marked at each endpoint and at all intermediate pull/access points or junction boxes. Label shall indicate origination and destination Telecommunication Rooms, sheath ID and strand or pair range.
 - c. Meet the legibility, defacement, exposure and adhesion requirements of UL 969.
 - d. Be pre-printed or laser printed type.
 - e. Where used for cable marking, a label with a vinyl substrate and white printing area and a clear "tail" that self laminates the printed area when wrapped around the cable shall be provided. The label color shall be different than that of the cable to which it is attached.
 - f. Where insert type labels are used, provide clear plastic covers to go over label.

- g. The Contractor shall confirm specific labeling requirements with the Owner or Owner's Representative prior to cable installation or termination.

N. Documentation:

- 1. All cable inventory data documentation shall be submitted in format coordinated with and approved by Owner so that data can be incorporated into existing databases.
- 2. Documentation shall include cable identification number, source and destination, type of cable, length of cable and number of pairs or fibers.
- 3. Complete cross connect documentation is required. It shall include detailed documentation of each pair of all copper backbone cable and strand of fiber.

3.2 CLEANING

- A. All surfaces, cabling, and hardware shall be kept clean and free of dust and debris.
- B. Clean as needed and protect as required to maintain this requirement.

3.3 ACCEPTANCE

- A. Once all work has been completed, test documentation has been submitted and approved, and the Owner is satisfied that all work has been completed in accordance with contract documents, the Owner will notify Contractor in writing of formal acceptance of the system.
- B. Contractor's RCDD shall warrant in writing that 100% of the installation meets the requirements specified herein.

3.4 WARRANTY

- 1. Provide CommScope SYSTIMAX full cabling solution 25-year warranty.
 - a. 25 Year Extended Product and Application Warranty (System Warranty)

REFER TO SECTION 27 00 00

END OF SECTION

SECTION 27 1600

COMMUNICATIONS CONNECTING CORDS, DEVICES AND ADAPTERS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Requirements for connecting cords, devices and adaptors, supplementing requirements found in the related sections.
- B. Related Sections
 - 1. 270000: Communications
 - 2. 270820: Copper Testing
 - 3. 271500: Communications Horizontal Cabling

1.2 WORK INCLUDED

- A. The Work of this Section shall consist of the labor, materials and equipment required for furnishing and installing telecommunications patch cables and equipment cords as part of a complete and functional telecommunications system.
- B. All items specified or included in this section shall be furnished and installed by Telecommunications Contractor, wired and connected by Telecommunications Contractor and tested by Telecommunications Contractor, unless noted otherwise. "Contractor" as used herein shall mean Telecommunications Contractor or Telecommunications Contractor's sub-contractor.
- C. Communications Patch Cords, Station Cords, and Cross-Connect Wire
 - 1. Data cable assemblies for the horizontal cross-connect and the workstation shall match horizontal, patch panel, and jack Category.
 - 2. Data cable assemblies shall be factory-assembled by the manufacturer of the cabling system.
 - 3. Provide data backbone factory-terminated fiber optic cable assemblies (Duplex LC to LC duplex) using duplex XG 850nm laser-optimized 50/125µm and Single-mode cable cross-connect assemblies in equipment rooms.
 - 4. Provide patch cord quantities on shop drawings.

1.3 COORDINATION

- A. Furnish and install the following:
 - 1. Patch and Equipment cords, for both copper and fiber.
- B. Electrical Contractor shall furnish and install the following:
 - 1. Floor boxes, box covers, straps.
 - 2. Boxes above ceilings and box covers.
- C. Unless noted, the following items will be the responsibility of the Owner:
 - 1. All electronics and active data networking equipment, etc.
 - 2. Telephones, fax machines and modems, etc.
 - 3. PC's, printers, video display terminals, flat panel displays, etc.
- D. Contact the Owner's network and computer equipment personnel for specific instructions before starting Work.

PART 2 - PRODUCTS

2.1 COPPER PATCH & EQUIPMENT CORDS

- A. Patch cables and equipment cords shall be factory pre-connectorized, TIA/EIA compliant matching horizontal cable specifications, 4 pair UTP, 8-position modular jack, and stranded conductors. Patch cables and equipment cords shall be able to withstand at least a minimum of 200 jack mating cycles without any transmission degradation.
- B. Provide all cords the same Category rating as cable, jacks and patch panels installed.
- C. Patch Cables For Equipment Rooms:
 - 1. Provide one box of (50) fifty five-foot **WHITE** cords for every voice patch panel
 - 2. Provide one box of seven-foot **BLUE** cords for every data patch panel.
- D. Provide equipment cords as necessary for the project with the following guidelines:
 - 1. Provide (1) one five-foot white plenum patch cord for every jack in above ceiling outlets
 - 2. Provide one 14-foot blue Cat6A cord for every data jack in every outlet. Provide one box of 50 7-foot green Cat6A patch cords. Provide twenty (20) 7-foot yellow Cat6A patch cords. Provide twenty (20) 20-foot yellow Cat6A patch cords.
 - 3. Coordinate with CLPCCD for list of other patch cords, lengths and quantities to be included in the project.
- E. Connection Reliability
 - 1. Use connectors with 50 μ m gold-plated tines (as specified by TIA standards), as well as designs that distance the connection point between the connector tines and plug from the arcing damage.
 - 2. Connectors should also meet contact resistance requirements found in the IEC 60512-99-001 standard covering connectors for electronic equipment.
- F. Manufacturer – CommScope Slimline cables

2.2 WET ENVIRONMENT PATCH CORDS

- A. Provide black CommScope Category 6A OSP patch cords, length as required, for every outlet / jack connecting to exterior communications devices (i.e. cameras, access points, etc).

2.3 FIBER OPTIC PATCH CORDS

- A. Provide the following:
 - 1. Six (6) 10-foot ST-LC duplex **RED** OM1 patch cords
 - 2. Six (6) 10-foot LC-LC duplex **RED** OM1 patch cords Provide duplex **YELLOW** TERASPEED single mode patch cords for data backbone.
 - 3. Six (6) 3-foot) single mode fiber SC-SC cords

PART 3 - EXECUTION

3.1 ADDITIONAL INFORMATION

- A. Refer to Section 27 00 00 for submittal and other general requirements

3.2 INSTALLATION

- A. Deliver patch cords to the Owner in factory sealed packages, requesting their sign-off on packages as delivered as specified.
 - 1. Coordinate on delivery timing with GC and Owner to ensure any circuits required for permit or occupancy certificates will be active and connected on time.

- B. Maintain bend radius of cables as recommended by the manufacturer and per BICSI standards.

END OF SECTION

SECTION 27 4100 - AUDIOVISUAL SYSTEMS

PART 1 - GENERAL

1.1 PROJECT DESCRIPTION

- A. Project is at the Las Positas College at 3000 Campus Hill Dr in Livermore, CA 94551

1.2 DEFINITIONS

- A. Refer to Division 00 and 01 Specification Sections for project definitions.
- B. Refer to CLPCCD Cabling Infrastructure Standards.
- C. "AV" - Audiovisual
- D. "AV Contractor" - Company contracted to provide scope of work as described in this specification section.
- E. "Consultant" - Salter
- F. "District" – Las Positas College
- G. "Architect" – SmithGroup
- H. "AV Drawings" – "TA" and "AV" Series Drawings
- I. "OFE" - Owner-Furnished Equipment.
 - 1. Equipment furnished by District and installed by the AV Contractor as described in this specification section
- J. "GUI" - Graphical User Interface
- K. "GC" – General Contractor, Roebuck Construction

1.3 SCOPE OF WORK

- A. This specification section and associated AV Drawings provide a full description of AV Contractor scope of work.
- B. Refer to general conditions and drawings by others for related work. AV Drawings include infrastructure that may be provided by other divisions; verify AV Contractor scope of work with General Contractor prior to bidding.
 - 1. Refer to "TA" Series drawings for infrastructure to support AV systems that will be provided by GC.
- C. Refer to Divisions 00, 01, general conditions, and the following specification sections and drawing series for related work:
 - 1. Architectural
 - 2. Interiors
 - 3. Telecommunications

4. Security
 5. Electrical
- D. The following spaces require audiovisual installation under this scope of work:
1. B1800:
 - a. Engineering Materials 1802
 - b. Engineering Electrical 1805
 - c. Physics Lab 1807
 - d. Physiology 1810
 2. STEAM:
 - a. Microbiology 15109
 - b. Physiology 15105
 - c. Anatomy 15106
 - d. Anatomy 15104
 - e. Shared Learning Anatomy 15102
 - f. Cadaver 15104A
 - g. Photography Comp. Lab 15101C
 - h. Graphic Design Lab 15103
 - i. Intro Chem 15212
 - j. Intro Chem 15216
 - k. Gen Chem 15215
 - l. Gen Chem 15211
 - m. Organic Chem 15203
 - n. Painting Studio 15202
 - o. Drawing Studio 15204

1.4 SYSTEM DESCRIPTIONS

- A. Classrooms and Labs
1. Classrooms and Labs will be used for local instruction and learning.
 2. Ceiling-mounted projector(s) and 16:10 aspect ratio motorized projection screen(s).
 3. A wireless presentation device will allow instructors or students to cast content onto the projection screen from a variety of mobile and wireless devices.
 4. Ceiling-mounted loudspeakers for program audio and speech.
 5. An assistive listening system (ALS) will allow hearing-impaired students to hear program audio and speech.
 6. HDMI, USB-C, and DisplayPort at Instructor's desk for laptop computers, document cameras and other devices.
 7. Document camera
 8. Owl-Camera brought in as needed for conferencing.
 9. Touch-panel on Instructor's desk to allow control of AV system.
- B. Cadaver Room
1. (4) overhead closed circuit cameras in Cadaver Room above cadaver stations; password protected live camera-feeds accessible to Anatomy Room AV system touch-panels for projection or monitoring
- C. Conference Rooms
1. Conference rooms will be used for local and remote collaboration and communication.
 2. Wall-mounted display
 3. A wireless presentation device will allow instructors or students to cast content onto the projection screen from a variety of mobile and wireless devices.
 4. Video-conference-bar beneath display with microphone, camera, and speakers
 5. An assistive listening system (ALS) will allow hearing-impaired students to hear program audio and speech.

6. HDMI, USB-C, and DisplayPort at cable-cubby, served from wall-plate, for laptops
7. Touch-panel on conference table to allow control of AV system.

1.5 AV CONTRACTOR RESPONSIBILITY

- A. Furnish and install a complete and functioning audiovisual system including cabling, receptacle plates, loudspeakers, and electronic devices. Provide and install all components including the necessary equipment, interconnections, transducers, labor, and services required to meet specifications herein and as indicated on the drawings. Any item listed in the specification or shown on the drawings is to be included as part of this scope of work. Items specifically indicated on the drawings as "Not in Contract" are not to be provided.
- B. By bidding on this scope of work, the AV Contractor confirms that the system functionality described herein can be achieved with the equipment and conditions described. Additional labor, materials, or connections required are the responsibility of the AV Contractor. AV Contractor shall notify the District if it is believed the described system functionality cannot be achieved with the equipment or conditions identified in this scope of work.
- C. IT Coordination: Coordination as required with the District's IT representative where network related system configuration is required.
- D. Verify site conditions including dimensions, clearances, conduit sizes, and routing. Coordinate the exact location of the equipment with the architectural drawings. Report any conflicts that may interfere with systems installation.
- E. Verify that 120-volt AC power has been supplied near each equipment rack location, or any other location requiring AC power. Provide connection in flex-conduit from nearby AC power to equipment racks, where AC power receptacles are not located within the equipment rack enclosure. Provide and install all AC power receptacles within the equipment racks. Provide low-voltage turn-on controllers and switched outlets to activate and distribute AC power within the equipment racks.
- F. Notify the District's Representative in writing prior to AV installation of any penetrations at walls, ceilings and floors required for the installation of audiovisual equipment and cabling.
- G. Verify that the systems have been engineered prior to installation of suspended devices including, but not limited to, loudspeakers, microphones, flat panel monitors, video projectors, etc. Verify any attachment points and methods with licensed structural engineer prior to installation.
- H. Provide ventilation as required for equipment housed in millwork so that manufacturer-recommended temperatures are maintained during normal operating conditions.
- I. Conduct preliminary testing and adjustment. Submit documentation required by this specification. Participate in approval testing for acceptance. Perform final adjustments as required to meet specifications.
- J. Transfer all warranties and equipment guarantees and provide a written description of system operation to the District at the time of acceptance of the work by the District.
- K. Provide system operation training as described in this specification section.
- L. Provide "as-built" drawings of all systems, including modifications to the as-built infrastructure if any, on full sized sheets. Revisions are to be made to the actual CAD computer files (red

pen revision markups on paper drawing sheets are not acceptable) prior to print out. Provide CAD files on USB flash drive or storage format preferred by the District. Provide Control Panel and control system source code, DSP system configuration files, and all systems initial configuration preset files to Owner. Store files on site in the system documentation binders in disk sleeves.

- M. Owner Furnished Equipment: The AV Contractor shall be responsible for integrating owner-furnished equipment into the audiovisual systems as shown on the AV drawings.
- N. Perform all operations necessary to complete the installation.
- O. The audiovisual systems and components described in this specification section shall be free of any manufacturing, engineering, installation, or operational defects.
- P. AV Contractor shall provide installation that meets or exceeds applicable building codes.
- Q. System Programming and Graphical Interface Design
 - 1. The AV Contractor shall work with the District and/or Consultant to provide an agreed-upon GUI for all AV system Control Panel interfaces based on the District's standards.
 - 2. Provide all Control Panel, control system, audio DSP, and audiovisual processing equipment source code created for the project to the District upon system acceptance.
- R. Millwork
 - a. Coordinate audiovisual system components in millwork and furniture. Contractor shall perform all cutting, patching and painting as required, and shall repair any damage done as a result.

1.6 QUALITY ASSURANCE

- A. All materials must be newly manufactured current production models and must conform to all applicable codes and the relevant standards listed below:
 - 1. American National Standards Institute (ANSI)
 - 2. Electronic Industries Association (EIA)
 - 3. Institute of Electrical and Electronic Engineers (IEEE)
 - 4. Underwriters Laboratories (UL)
 - 5. "B" stock and/or refurbished items are not acceptable.
- B. Contractor Qualifications
 - 1. Experience: The AV Contractor will specialize in the installation of audiovisual systems in professional/commercial environments. Installers and engineers must individually have a minimum of five years of documented experience in the field of audiovisual system installation.
 - 2. Dealership: AV Contractor shall be an authorized dealer for all products listed, and shall perform any manufacturer training, certification, or other specialized requirements recommended by the manufacturer prior to installation. AV Contractor shall offer full factory warranty on all products provided.
 - 3. Certification: Bidder must have at least (1) employee staffed on the project in a supervisory role with either CTS-D or CTS-I certification from InfoComm International.
 - 4. Contractor shall be Crestron A+ Partner and shall honor Crestron A+ pricing structure.
 - 5. The AV contractor shall be trained and certified through the Crestron Technician/Field Engineer track, such that the completed installation is registered with Crestron for a 4-year advanced replacement/repair warranty.
- C. Supervision

1. The AV Contractor will designate a single supervisor to oversee the installation work for the duration of the project to ensure that the system is installed in accordance with the specification and drawings.
2. The supervisor will maintain adequate staff and be responsible for installing and testing the system on schedule.
3. The supervisor will have at least five years of documented, recent, and similar project experience.
4. The District reserves the right to make use of the system prior to the completion of the punch list. Temporary use of the equipment will not constitute an acceptance of the system or any part. The District will not pay additional cost to the AV Contractor and the commencement of the warranty period will not begin for the system or any device prior to the completion of the punch list and final acceptance of the system by the District.

D. Codes: AV Contractor will comply with all applicable laws, regulations and codes.

1.7 SUBMITTALS

A. Comply with submittal requirements Division 01 General Requirements.

B. Bid Submittals: Submit the following qualification documents:

1. Firm description.
2. Submit a list of authorized dealerships. The AV Contractor must be a dealer for any devices installed in this project to assure the installers are trained and that the dealer has a path for warranty repair as needed.
3. List of related projects: Related project list to include project name and location, description of project, contract amount, reference name and telephone number. One of the related projects must have been completed within the last 12 months.
4. Resumes of project supervisor documenting related experience. Project supervisor must have completed at least one installation in the past 12 months.
5. Names and scope of work for any subcontractors whose work would be part of this contract.
6. Clearly list and describe any deviations from and exceptions to the specifications or drawings.
7. As part of the AV Contractor's bid, a fully itemized list shall be provided showing the manufacturer's cost basis for each piece of equipment by room or system. This cost basis may be used by District to substitute in comparably priced up-to-date equipment that is brought to market after the construction submittal period.
8. Provide an optional price for maintenance contract extensions on an annual basis beyond the initial one-year warranty period.

C. Construction Submittals:

1. Submit complete equipment list by manufacturer, model number, and type. Include all accessories, options and functional components, and quantity to be supplied.
2. Equipment Substitutions
 - a. All submitted equipment must meet the minimum performance requirements shown in Part 2 of this specification.
 - b. Post-Submittal Equipment Update Substitutions: As there is a time gap between construction submittals and equipment installation, the District reserves the right to request substitutions of outdated equipment for updated equipment of a comparative class and cost basis. This arrangement is required of video projectors and flat panel displays. For video projectors, the contractor should attempt to provide substitutions to limit the number of different equipment manufacturer's for ease-of-maintenance considerations. Specified projector and

- flat panel mounting hardware will need to be re-evaluated to meet the requirements of the final projector selection.
3. Submit shop drawings for each building space included in this specification with the following drawings (as required by specific system):
 - a. Point-to-point functional wiring diagrams for all audio, video, control, and related signal system wiring diagrams. Must be connector pin-specific. Re-used Audiovisual Consultant design drawings with wire run numbers added are not acceptable for field construction use. Engineered drawings are not to have devices nor connections noted "typical". Show pin-specific wiring connections with wired numbers noted.
 - b. All receptacle plates and panels, including rack-mount panels labeling shown for engraving.
 - c. Equipment rack elevations.
 4. Submit shop drawings of any proposed design changes for approval prior to fabrication. Shop drawings are submitted for review and approval prior to fabrication and installation. Make submittals at least fifteen (15) working days prior to scheduled fabrication. Note on the submittal the dates of scheduled fabrication.
 5. Submit samples of engraved labels, cable marking system, and receptacle plate/panel etching.
 6. Acceptance Test Submittals: Prior to requesting the completion of the acceptance tests, submit Preliminary Test Report including all information required in Part 3. The AV Contractor is to provide a letter on company letterhead verifying that all devices and signal inputs have tested and are operable. This letter is to be signed by the project manager and sent to the consultant before acceptance testing can proceed.

1.8 PERMITS AND INSURANCE

1. Permits: Obtain any necessary permits for the execution of this work in conformance with applicable union regulations, local, State and Federal codes and regulations.
 - a. Insurance: Provide evidence of insurance for the full value of equipment and material located on site. Insurance will cover all losses until the work is formally accepted. Maintain additional liability insurance to protect the supplier and/or District against damage claims for personal injury, including death, which may arise during the performance of this work.

1.9 GUARANTEES AND WARRANTIES

- A. Transfer all manufacturer warranties to the District at the time of acceptance.
- B. Guarantee all installation work to be free of faulty workmanship. Guarantee all components and workmanship to be free from defects for a period of one year from the final date of acceptance, including solid-state devices.
 1. Provide an optional price for maintenance contract extensions on an annual basis beyond the initial one-year warranty period.
- C. Guarantee the replacement of faulty materials and workmanship within 48 hours of notification at no cost to the District if failure occurs during warranty period.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR AUDIOVISUAL PRODUCTS

- A. Materials listed herein represent specific minimum levels of performance and function. These levels of performance and function are as published by the listed manufacturers. All material

submitted shall be as listed or shall be substitutions that meet or improve upon the performance and functional characteristics of the listed material.

- B. If conflicts exist within the specification or between the specification and the drawings, contact the Consultant for clarification. Where listed quantities differ from that shown on drawings, assume the greater quantity and contact AV consultant for clarification.
- C. Equipment shall be procured from the original equipment manufacturer, or a manufacturer-approved dealer. If procured from a manufacturer-approved dealer, product(s) shall be supported at the same level as if procured from manufacturer.
- D. Repair or replace any equipment damaged during installation.

2.2 EQUIPMENT

- A. B1800:
 - a. **Engineering Materials 1802**
 - 1) OFE; use equipment procured by LPC; test existing cabling and provide new as necessary
 - b. **Engineering Electrical 1805**
 - 1) OFE; use equipment procured by LPC; test existing cabling and provide new as necessary
 - c. **Physics Lab 1807**
 - 1) OFE; use equipment procured by LPC; test existing cabling and provide new as necessary
 - d. **Physiology 1810**
 - 1) OFE; use equipment procured by LPC; test existing cabling and provide new as necessary
- B. STEAM:
 - a. **Digital Signage**
 - 1) Video Devices:
 - a) 65" Display: Samsung QM65C
 - b. **Physiology 15105 & Microbiology 15109**
 - 1) Cable & Hardware
 - a) Cable Cubbies: Extron Cable-Cubbies
 - b) Instructor Desk w/ Rack: Spectrum Industries 68020CHB
 - c) 12 Outlet Rackmount Power Strip: Tripp Lite RS1215-RA
 - d) Power Conditioner: Furman PL-Pro C
 - e) 24V Switching Power Supply: RDL PS-24AS
 - 2) Audio Devices
 - a) Ceiling loudspeakers: Crestron Saros IC6T
 - b) Crestron 70v Amplifier: AMP-2100-70
 - c) Line Level DA: RDL ST-DA3
 - d) Assistive Listening System: Listen Technologies RF/IR
 - e) Wireless Microphone Receiver: Shure ULXD4D
 - f) Wireless Microphone Body Pack: Shure ULXD1
 - g) Wireless Microphone Body Pack - Lav: WL185
 - h) Wireless Microphone Battery Charger: Shure SBC10-100-US
 - i) Wireless Microphone Battery: Shure SB900A
 - j) Audio DSP: [integral to Video Switcher]
 - 3) Video Devices:
 - a) Video Projector [1920 x 1200; WUXGA]: Panasonic PT-MZ882
 - b) Collaboration Monitors: Promethean ActivPanel 9 with ActivPanel stand, camera, and soundbar

- c) Video Switcher & Audio DSP: Crestron HD-PS622
- d) HDMI TX (box): Crestron DM-TX-4KZ-302-C
- e) HDMI RX (box): Crestron DM-RMC-4KZ-SCALER-C
- f) HDMI TX (wall-plate): Crestron DM-TX-4KZ-100-C-1G-B-T
- g) HDMI RX (wall-plate): Crestron DM-RMC-4K-100-C-1G-B-T
- h) HDMI/USB-C/DisplayPort Transmitter/Auto-switcher: Crestron HD-TX-4KZ-421-CHGR
- i) Wireless Presentation: Extron Sharelink Pro 2000
- j) Owl Camera: Owl Labs Meeting Owl 4+
- k) Document Camera: Wolfvision vSolution Cam
- l) Wacom Tablets: Wacom Cintiq Pro 16 [*for District Approval*]
- 4) Control Devices
 - a) Control Processor: Crestron RMC4
 - b) Touch-Panel: Crestron TSW-770
- c. **Anatomy 15104, 15106**
 - 1) Cable & Hardware
 - a) Cable Cubbies: Extron Cable-Cubbies
 - b) Instructor Desk w/ Rack: Spectrum Industries 68020CHB
 - c) 12 Outlet Rackmount Power Strip: Tripp Lite RS1215-RA
 - d) Power Conditioner: Furman PL-Pro C
 - e) 24V Switching Power Supply: RDL PS-24AS
 - 2) Audio Devices
 - a) Ceiling loudspeakers: Crestron Saros IC6T
 - b) Crestron 70v Amplifier: AMP-2100-70
 - c) Line Level DA: RDL ST-DA3
 - d) Assistive Listening System: Listen Technologies RF/IR
 - e) Wireless Microphone Receiver: Shure ULXD4D
 - f) Wireless Microphone Body Pack: Shure ULXD1
 - g) Wireless Microphone Body Pack - Lav: WL185
 - h) Wireless Microphone Battery Charger: Shure SBC10-100-US
 - i) Wireless Microphone Battery: Shure SB900A
 - j) Audio DSP: [integral to Video Switcher]
 - 3) Video Devices:
 - a) Video Projector [3840 x 2400; 4K]: Panasonic PT-REQ12
 - b) Collaboration Monitors: Promethean ActivPanel 9 with ActivPanel stand, camera, and soundbar
 - c) Video Switcher & Audio DSP: Crestron HD-PS622
 - d) HDMI TX (box): Crestron DM-TX-4KZ-302-C
 - e) HDMI RX (box): Crestron DM-RMC-4KZ-SCALER-C
 - f) HDMI TX (wall-plate): Crestron DM-TX-4KZ-100-C-1G-B-T
 - g) HDMI RX (wall-plate): Crestron DM-RMC-4K-100-C-1G-B-T
 - h) HDMI/USB-C/DisplayPort Transmitter/Auto-switcher: Crestron HD-TX-4KZ-421-CHGR
 - i) Wireless Presentation: Extron Sharelink Pro 2000
 - j) Owl Camera: Owl Labs Meeting Owl 4+
 - k) Document Camera: Wolfvision vSolution Cam
 - l) Wacom Tablets: Wacom Cintiq Pro 16 [*for District Approval*]
 - 4) Control Devices
 - a) Control Processor: Crestron RMC4
 - b) Touch-Panel: Crestron TSW-770
- d. **Shared Learning Anatomy 15102**
 - 1) Cable & Hardware
 - a) Cable Cubbies: Extron Cable-Cubbies
 - b) Instructor Desk w/ Rack: Spectrum Industries 68020CHB
 - c) 12 Outlet Rackmount Power Strip: Tripp Lite RS1215-RA

- d) Power Conditioner: Furman PL-Pro C
- e) 24V Switching Power Supply: RDL PS-24AS
- 2) Audio Devices
 - a) Ceiling loudspeakers: Crestron Saros IC6T
 - b) Crestron 70v Amplifier: AMP-2100-70
 - c) Line Level DA: RDL ST-DA3
 - d) Assistive Listening System: Listen Technologies RF/IR
 - e) Wireless Microphone Receiver: Shure ULXD4D
 - f) Wireless Microphone Body Pack: Shure ULXD1
 - g) Wireless Microphone Body Pack - Lav: WL185
 - h) Wireless Microphone Battery Charger: Shure SBC10-100-US
 - i) Wireless Microphone Battery: Shure SB900A
 - j) Audio DSP: [integral to Video Switcher]
- 3) Video Devices:
 - a) Touch-enabled 85" Display: Promethean Active Panel 9
 - b) Video Switcher & Audio DSP: Crestron HD-PS622
 - c) HDMI TX (box): Crestron DM-TX-4KZ-302-C
 - d) HDMI RX (box): Crestron DM-RMC-4KZ-SCALER-C
 - e) HDMI TX (wall-plate): Crestron DM-TX-4KZ-100-C-1G-B-T
 - f) HDMI RX (wall-plate): Crestron DM-RMC-4K-100-C-1G-B-T
 - g) HDMI/USB-C/DisplayPort Transmitter/Auto-switcher: Crestron HD-TX-4KZ-421-CHGR
 - h) Wireless Presentation: Extron Sharelink Pro 2000
 - i) Owl Camera: Owl Labs Meeting Owl 4+
 - j) Video-conference-bar: Logitech Rally Bar [for District Approval]
 - k) Document Camera: Wolfvision vSolution Cam
 - l) Wacom Tablets: Wacom Cintiq Pro 16 [for District Approval]
- 4) Control Devices
 - a) Control Processor: Crestron RMC4
 - b) Touch-Panel: Crestron TSW-770
- e. **Cadaver 15104A**
 - 1) Cable & Hardware
 - a) AV Rack: Middle Atlantic AX-SXR-15
 - 2) Video Devices:
 - a) HDMI/Fiber Cable: Kramer CP-AOCH/60
 - b) Video Matrix Switcher: Crestron DM-MD8x8-CPU3-RPS
 - c) HDMI DA: Crestron HD-DA2-4KZ-E
 - d) Control Processor: Crestron RMC4
 - e) Overhead Cadaver Cameras: *Integrated with Surgical Light (by others)*
 - f) Review Monitors: Crestron TSD-2220-B
 - g) Review Monitor Arm-Mount: Chief K2W120
- f. **Photography Comp. Lab 15101C**
 - 1) Cable & Hardware
 - a) Cable Cubbies: Extron Cable-Cubbies
 - b) Instructor Desk w/ Rack: Spectrum Industries 68020CHB
 - c) 12 Outlet Rackmount Power Strip: Tripp Lite RS1215-RA
 - d) Power Conditioner: Furman PL-Pro C

 - a. Physiology 1810

2.3 MISCELLANEOUS HARDWARE

- A. Terminal cabinets and boxes: terminal cabinets, mud-rings, and junction boxes housing audio cabling shall be metallic. Terminal cabinets shall be verified for size by AV Contractor prior to beginning job-site work. Size cabinets for required base-bid wiring fill. Allow forty percent (40%) additional capacity for future system growth.
- B. Provide matching manufacturer vents and blanks as required.
- C. Rack Connections: AC power cables to the power strips shall be run in steel conduit. All in-going and out-going signal cabling shall be run in conduit or cabling pathways independent of AC power cabling.
- D. Connectors: Provide compatible plugs as indicated on the receptacle plate drawing sheets; all cable connectors shall have black anodized finish where available unless otherwise noted. Connector parts subject to any possible structural loading or stress shall be metal.
- E. Conduit: Provide removable seals at penetrations for acoustic isolation.
- F. Audiovisual System Faceplates: Silk-screened and coated lettering shall identify individual plate mounted receptacles. Connector identification shall denote function and unique input/output number. Lettering shall be centered above appropriate connector. Connector mounting will allow sufficient finger clearance for connector insertion and removal without interference from adjacent connectors.
- G. Receptacle Plates:
 - 1. Receptacle plates shall be steel or aluminum with etched and ink filled labeling. Confirm plate color preferences and requirements with District prior to fabrication or ordering. Plates ordered without District approval may be replaced at AV Contractor's expense. Refer to AV Drawings for specific plate connector requirements.
 - 2. Center lettering vertically over appropriate connector. Connector mounting shall allow sufficient finger clearance for connector insertion and removal without interference from adjacent connectors.
 - 3. Engraved plastic labels fastened with epoxy are acceptable only where custom engraving options are not available from manufacturer, and only with approval by the District.

- H. Provide black Techflex cable wrap as required for cable umbilical bundles.
- I. Provide acoustical insulation such as Rock Wool or acoustic cotton such as UltraTouch for loudspeakers mounted in wall cavities.
- J. Electronic component faceplate labels: Provide permanent labels on equipment to identify device, system, or control function as appropriate for operational purposes. All control knob and switch labels shall be located vertically adjacent over the appropriate control. Engraved plastic labels fastened with epoxy are acceptable. Dymo type labels are not acceptable.
- K. Rack Equipment
 - 1. Provide placard at each AV equipment rack that states "Designed by Salter & Installed by _____ (AV Contractor name with phone and website). For repairs call _____ (AV Contractor name with phone)." Provide as either a rackmount panel, or as a placard attached to one of the equipment racks in each major control room equipment location.
 - 2. Rack-mounted blank plates.

2.4 PRE-MANUFACTURED CABLES

- A. Pre-Manufactured Cables for Receptacle Plates (HDMI, Audio): Provide one cable with connectors for every end-user receptacle to connect laptop computers, and other portable audiovisual source devices:
 - 1. Gold-Plated Connectors
 - 2. NEC CL2 rated non-plenum
 - 3. HDMI/DVI Input: Cables must be rated for HDMI 2.0a specifications or better, capable of passing required resolutions, frame rates, and color space at distances under 10' without an active equalizer.
 - 4. Audio: 20 to 20Khz
 - 5. Recommended Equipment: Extron, various models.
- B. HDMI(F)-to-Display Port(M) Adapter: For every pre-manufactured HDMI cable provided, provide an adapter for Display Port source devices.

2.5 INSTALLATION CABLE – ALL SPACES

- A. Loudspeaker Cable (8 or 4 ohm, less than 500 watts): West Penn Wire C207 (12 AWG, unshielded pair) or equal
- B. Distributed Non-Plenum Loudspeaker Cable (70volt, less than 60-Watt tap): Belden 1309A (14 AWG, unshielded pair) or equal.
- C. Distributed Plenum Rated Loudspeaker Cable (70volt, less than 60-Watt tap): Belden 6100UE (14 AWG, unshielded pair) or equal.
- D. Analog Microphone/Line Level Installation Cable: Belden model# 9464 (20 AWG conductor, jacketed, shielded, twisted-pair) or equal.
- E. Analog Microphone/Line Level Installation Cable (Dining Room inputs, high noise rejection): Mogami W2534 (24AWG 4-conductor, jacketed, shielded, twisted-pair) or equal.
- F. Analog Microphone/Line Level Equipment Rack Interconnect Cable: Belden model# 8450 (22 AWG conductor, jacketed shielded, twisted-pair) or equal.

- G. Antenna Cable: Conductor is 13 AWG (RG8/U) covered by braided shield. JSC model# 3040 or equal. Provide co-axial cable whose impedance matches devices requiring 50ohm antenna connection.
- H. Digital Media Cable: DM-CBL-8G-NP-SP500
- I. Pre-Terminated HDMI cables: Extron, Atlona, or equal. (Note, cables must be rated for HDMI 1.3a specifications or better, capable of passing 1080p or 1920x1200 resolution at distances under 10' without an active equalizer.)
- J. Control System Device Control Cables (RS232, RS422, Serial (IR), Relay or Contact Closure): Supply pre-terminated serial control cables within equipment racks. Provide West Penn Wire 1992 (4 pair) signal cable, or equal for relay or contact closure application, as required.
- K. Network and twisted pair Cable for AV Signal Extenders: Provide project network standard Category 6 cable, or equal.
- L. All cabling shall be rated for the environment for which it is placed.
- M. Provide plenum rated cable for all cable where required by code. Any cable changes or substitutions must be submitted and approved prior to installation. Cable that has been installed without approval is replaced at the AV Contractor's expense.
- N. For HDMI runs over 25' AV Contractor shall provide HDMI over shielded CAT6 extension system.
- O. Cable installed without District approval may be replaced at the AV Contractor's expense.
- P. Acceptable Cable Manufacturers:
 - 1. Liberty
 - 2. Belden
 - 3. West Penn
 - 4. Canare
 - 5. Mogami
 - 6. Extron
 - 7. Crestron
 - 8. Windy City Wire

2.6 CONNECTORS

- A. Audio 1/4" panel-mount connector: Switchcraft 1/4" TS, solder back, or equal.
- B. Loudspeaker Connectors: Neutrik 4-Pole Speakon series.
- C. HD-SDI, Composite Video, Genlock (Sync), SMPTE BNC panel-mount connector: Provide a panel-mounted BNC jack with isolated ground bulkhead and compatible connector. Supply Canare BCP-C5FA male, or equal.
- D. Antenna connector: Provide receptacle plate-mounted general-purpose UHF antenna connector. Coaxial bulkhead connector will match impedances of antenna cable and match style of connector on device requiring antenna. Supply Amphenol 83-1f.

- E. RS232/Control D-Shell Panel-Mount Connector: Mouser D-sub series, or equal.
 - F. Specialty RJ45 connectors (UTP Extenders, etc.): Supply Neutrik Ethercon series connectors where AV connections are to be terminated at AV receptacle plates and panels.
 - G. CAT6 8-Pin Modular Chassis Connector at Receptacle Plates
 - 1. CAT6 Compliant up to 10GBits/s
 - 2. CAT6 specifications according TIA / EIA 568B, ISO / IEC 11801, EN 50173
 - 3. Push Pull mating - secure and proven locking system
 - 4. Ground lead jumper on panel connector with selectable grounding option
 - 5. Gas-tight IDC termination without tool
 - 6. Recommended equipment: Neutrik NE8FDY-C6-B
- 2.7 FINISHES
- A. All enclosures, housings and fixtures supplied by the AV Contractor not having a standard factory protective finish are to be painted. Paint specifications are to be supplied by the Architect or indicated herein.
 - B. Any equipment or materials supplied which are exposed to public view are to be approved by the District. Provide, as required by the District, custom color and/or finish for publicly-visible devices, if available.

PART 3 - EXECUTION

3.1 GENERAL DESCRIPTION

- A. The following is required for acceptance of the audiovisual system by the District:
 - 1. Install complete and functioning audiovisual system specified.
 - 2. Label equipment and cables as specified and corresponding to functional diagram.
 - 3. Conduct adjustments and preliminary testing.
 - 4. Report results of preliminary testing along with system documentation.
 - 5. Participate in acceptance test and deliver final system and documentation.
 - 6. Conduct any adjustments or re-testing that is required to adhere to the specifications.
 - 7. Provide training to individuals designated by the District.
- B. Installation shall meet or exceed industry standards and best practices, including, but not limited to, those described in the following publications:
 - 1. InfoComm International
 - a. "Basics of Audio and Visual Systems Design"
 - b. "AV Installation Handbook"
 - c. "AV Implementation Handbook"
 - 2. Building Industry Consulting Service International (BiCSi), "Telecommunications Distributions Methods Manual" (TDMM)
 - 3. Telecommunications Industry Association/Electronic Industries Alliance (TIA/EAI), "TIA/EIA Wiring Standards"

3.2 GENERAL REQUIREMENTS

- A. All equipment except portable equipment shall be held firmly in place. This includes racks, conduits, cables, receptacle plates and panels, and all electronic equipment. The District shall approve structural fastenings and supports.

- B. Submit shop drawings for custom fabrications including custom panels, receptacle plates, patch panel layouts, and rack elevations to the District for review and approval. Make submittals at least fifteen (15) days prior to scheduled fabrication. Note on the submittal the dates of scheduled fabrication. Submittal responses is expedited due to the compressed installation schedule.
- C. Do not commence work on any portion of the project requiring District 's approval prior to obtaining such approval. Work commenced and installed prior to review and approval shall be accepted at the District's discretion. Installation does not imply acceptance or review for acceptance.
- D. Keep at the job site an up-to-date complete record set of prints and specification. Make daily corrections and show all changes from the original contract drawings. Final as-built drawings are required at the conclusion of the project.
- E. Keep the job adequately staffed at all times. A qualified engineer approved by the District and employed by the AV Contractor shall exercise engineering supervision over the entire installation. Unless through illness, loss of personnel, or other circumstances beyond the control of the AV Contractor, keep the same individual in charge throughout the execution of the work.
- F. Execute, without claim for additional payment, moderate moves or changes as necessary or required by the District prior to installation to accommodate minor design changes, rack layout changes, or to preserve symmetry and pleasing appearance.
- G. Conduct preliminary testing and adjustment. Submit documentation required by this specification. Participate in approval testing for acceptance. Perform final adjustments as required to meet specifications.
- H. Deliver bound "as-built" system documentation. Transfer all warranties and equipment guarantees and provide a written description of system operation to the District at the time of acceptance of the work by the District. Provide system operation training as specified in Section 3.6.

3.3 INSTALLATION REQUIREMENTS

- A. General
 - 1. All equipment and cabling shall be installed in accordance with manufacturer recommendations, in a clean, neat, and organized fashion.
 - 2. Equipment requiring service or routine adjustments, such as equipment racks, shall be accessible for such services.
 - 3. All permanently installed equipment shall be plumb and square, and firmly held in place.
 - 4. Contractor shall take appropriate measures to minimize electromagnetic and/or electrostatic interference. Install all equipment and cabling with regard for minimization of induced electromagnetic and electrostatic noise.
 - 5. Cables and wiring in racks, consoles, connector boxes and on terminal strips shall be clearly marked between 2" and 4" from end of cable gasket/harness. Provide maximum label visibility. Indicate the signal type, wire number, source and destination and jack, receptacle or socket to which connector should be mated. Use appropriate diameter clear shrink tubing over surface of label for protection and permanence. Extend shrink tubing over label by approximately 1/4" at each end.

6. Contractor shall provide appropriate protection for equipment and related wiring in locations where extreme environmental conditions may occur.
 7. All audiovisual point-to-point signal cable is to be run in cabling pathways separate of AC power and network data conduit, except where identified on drawings.
 8. Verify that all AC power circuits designated for audiovisual equipment, both fixed-in-place and portable, are properly wired, phased and grounded. Report any discrepancies found to the District.
 9. Verify with District where secure attachments, such as Kensington locks or projector locks, are required for audiovisual equipment in public spaces due to theft or vandalism concerns. Provide such attachments where required.
 10. Confirm finish color of publicly visible devices, such as loudspeakers, with District and/or Architect prior to ordering. Any publicly visible devices installed without prior approval may be replaced at the AV Contractor's expense.
- B. Mounting
1. All permanently mounted equipment shall be attached to the structure and held firmly in place. Provide brackets, braces and supports as required. Verify mounting with structural engineer prior to installation.
 2. Provide for (5) degrees of adjustability for any angular orientation shown in drawings.
 3. Verify structural mounting, backing, and reinforcement points prior to installation.
 4. Provide trim/escutcheon hardware for hardware penetrating finished ceilings. Verify finishes of trim components with Architect prior to ordering.
- C. Cabling
1. General
 - a. All cabling shall be continuous and without splices.
 - b. Maintain proper positive/negative phase between all points in the system.
 - c. Use care in wiring to avoid damage to cables. Where required, use temporary guides, sheaves, rollers, or other necessary devices to protect cables from excess tension, abrasion, bending, or any other damage during pulling. Provide wire pulling lubricants in accordance with wire and cable manufacturer's recommendations.
 - d. Spacing between cable ties or is to be no less than six (6) inches.
 - e. Provide rubber or nylon grommets over edges of cable pass through holes in chassis, racks, boxes, plates, etc.
 - f. Provide ample service loops at cable endpoints so that plates, panels, and equipment can be demounted for inspection. Where no rear access to cable termination points on equipment exists, provide sufficient length of cabling so that equipment may be easily removed independent of other equipment.
 - g. No length of cable over 18", with the exception of service loops, shall be unsupported by wire-way, raceway, conduit, or other approved cable support.
 - h. Equipment that is to be moved during normal operation, such as slide-out shelves, shall be provided with adequate cable lengths to accommodate the full range of travel in each direction, and shall be dressed to avoid pinching or wedging in moving parts.
 - i. Install cabling so that there is at least 6" of separation between circuits carrying AC power.
 - j. Where cabling of different signal types must cross, they are to do so perpendicularly as to minimize interference from one another.
 - k. Bending radii shall be minimum of (10) times the outer diameter of the cable jacket
 - l. Conduit fill ratios are not to exceed 40% of internal conduit area.
 2. Termination
 - a. All connections to jacks and connectors shall employ rosin-core solder, with no cold joints or splatter.

- b. Except for the case of screw terminals, all bare wire conductors are to be tinned with resin flux.
 - c. Screw-terminated conductors shall be wrapped in the same direction as screw rotation when tightening.
 - d. Provide clear shrink tubing sleeve over each individual wire termination and solder lug. All exposed shield drain wire shall be sheathed in properly sized clear shrink tubing sleeves and protected against shorting to other conductors or connector shells.
3. Labeling/Identification
- a. All cabling shall be permanently labeled with unique numbers using wire makers printed via computer software program. Maintain consistent labeling practices across all cabling, including numbering, signal type identification, and text direction. Provide "run sheets" listing all cables by number, signal type, and termination type on both ends. Labeling information is to include the following:
 - b. Cabling for audiovisual systems shall be of a different jacket color than other low-voltage cabling where pathways are shared between divisions or other systems.
4. Audio
- a. Audio system shall be free of audible hum, noise, buzz, and distortion.
 - b. Balanced audio connectors shall be terminated in accordance with the international (IEC) standard: Pin 1: shield, Pin 2: audio positive, and Pin 3: audio negative.
 - c. All audio signal conductors connected between active devices shall be electronically balanced or transformer balanced with respect to the audio signal ground. Unbalanced audio circuits, where possible, shall utilize level matching interfaces with active balanced circuitry or isolation transformers.
 - d. When connecting unbalanced and balanced line-level signals, refer to RaneNote 110: "Sound System Interconnection" for proper wiring techniques.
 - e. Where there are unused conductors in a cable assembly, fold unused cables along outer jacket and cover completely with heat-shrinkable tubing.
 - f. Microphone and line level signal cabling shall be installed at least 3" from other low-voltage cabling
 - g. Bridle rings suspended from ceiling or shared cable tray shall be provided in conditions where audio cabling is to share cable tray or pathways with other low-voltage cabling.
- D. Equipment Racks
- 1. Cabling within equipment racks shall be neatly bundled and laced. AV Contractor shall, at no additional cost, re-bundle and lace cabling if directed by District and/or Consultant. Utilize cable tie-bars as necessary. Harnessed cables are to be combed straight.
 - 2. Placement of equipment in equipment racks, as shown in the drawings, is for operator convenience, ventilation and/or circuit flow. Verify any changes in placement of the equipment with the Consultant prior to assembly.
 - 3. Provide ventilation adequate to keep temperatures within equipment racks below 90 degrees F. Provide approved passive and/or active ventilation as required.
 - 4. Racks shall be installed plumb and square within the room, and without twists in the frames or variations in level between adjacent racks.
 - 5. Custom panels shall be manufactured in order to prevent panel deformation during normal plugging and switching operations.
 - 6. Equipment requiring user interface shall be mounted between 18" and 48" AFF.
 - 7. The front and rear of each rack-mounted device shall be labeled with labels (i.e. "Video Switcher #"); as well as all occupied slots in card frame devices.
 - 8. Mount equipment using equipment rack manufacturer-approved black machine screws with nylon washers.

9. Heavy and/or deep equipment shall be provided with additional mounting hardware to support rear of equipment.
 10. Unless otherwise shown on AV Drawings, heavy equipment, such as amplifiers, shall be mounted towards the bottom of the rack.
 11. Provide code-required seismic restraints as necessary.
 12. Electrical Requirements:
 - a. Where power sequencing devices are required, the following On/Off sequencing shall be provided:
 - b. Control system components shall remain powered up and functional to accept control system commands.
 - c. Audio amplifiers and/or powered loudspeakers are to power up last and power down first to prevent loudspeaker damage.
 - d. Sequence the turn-on of devices so that AC power in-rush current is minimized.
- E. Loudspeakers
1. Provide structural support for wall and ceiling-suspended loudspeakers.
 2. Adjust distributed loudspeaker transformer taps, audio DSP, and amplifier levels for uniform consistency in sound pressure level throughout serviced area(s).
 3. Orient loudspeakers for optimal coverage of intended listening area. Perform adjustments as required to optimize coverage uniformity.
 4. Provide rigid support members to prevent loudspeaker from moving during operation after final adjustments have been made.
 5. Provide jumper configuration on Atrium Loudspeakers to optimize coverage to the stair seating.
- F. Video Projectors and Monitors
1. AV Contractor shall review and assess field conditions and select video projector lens(es) with appropriate focal lengths prior to ordering. The image is to completely fill the screen. The AV Contractor shall adjust video projector(s) and lens(es) for optimal picture quality, including lens focus, lens shift, and keystone adjustments.
 2. Refer to AV Drawings for video projection screen sizes and locations.
 3. Provide full video projector and monitor calibration, configuration, and adjustments for all used inputs. Adjust aspect ratio configuration so that all installed sources fill the projection screen completely, without unnecessary scaling or stretching.
 4. Configure EDID settings for all analog and digital video sources as required for proper compatibility between video sources. Video scaling is to be minimized as much as possible, so that a video source is scaled no more than (1) time within the overall system.
 5. Provide a query command via bi-directional protocol (serial or network) regarding projector lamp life, and provide a means to display that lamp life, either on a Control Panel display at start-up, or via network settings that send notifications to appropriate maintenance staff. Coordinate with District regarding desired notification format.
 6. Video monitors shall be set to initiate "Standby" mode when no input source is detected and return to "On" state once a video source is detected.
- G. Wireless AV Systems
1. Verify available wireless RF frequencies on site over a 24-hour period prior to ordering any wireless RF equipment, including wireless microphone or hearing assistance systems. Verify frequency selection with manufacturer. If available frequency spectrum does not allow for the use of specific wireless RF components, notify District in writing.
 2. Coordinate frequencies of all wireless devices, including District-provided devices.
 3. Locate wireless microphone receiver antennas for adequate signal reception. Provide additional antennas, amplifiers, Bias-Ts, or any other devices as required to ensure

adequate signal reception in the intended area. If the intended area is unclear, verify with Consultant prior to installation.

- H. Portable Equipment
 1. Where portable equipment will be routinely connected and disconnected, provide clearly labeled, color-coded connectors to correspond with correct connection points.
 2. Provide Techflex cable umbilical wrap, or equivalent, where multiple cables are connected at the same plate or location. All exposed cabling is to be bundled for a neat and clean appearance.
 3. Provide finish samples and shop drawings to District for approval prior to ordering any AV Contractor-provided furniture or millwork.

- I. Millwork Coordination
 1. Verify final equipment and millwork clearances prior to ordering any audiovisual equipment. Notify the District in writing if any conflicts are identified.
 2. Coordinate and submit dimensional information of audiovisual equipment to be incorporated into furniture or millwork provided by other divisions to District and/or Architect for approval prior to any cutting or penetrations.
 3. Provide fans, ventilation slots/holes, or other hardware in millwork as required to conform to the manufacturers' operational temperature requirements.

- J. Grounding
 1. Use the equipment chassis as a common point of grounding the sound system; the equipment chassis is to be grounded to earth. Cable shields shall only be used for shielding (not signal) and connected to ground at the rack. All equipment shall be checked for ground continuity.

3.4 PROGRAMMING REQUIREMENTS

- A. Audio DSP
 1. Coordinate with District to provide contact closure from fire alarm system(s) to audio DSPs, mixers, processors, and/or amplifiers to mute all audio when fire alarm system is engaged. Test functionality in all locations and systems. Coordinate with local fire safety agency for verification and sign-off.
 2. Verify specified audio DSP will provide adequate processing power with manufacturer to accommodate functionality as described in this specification section prior to ordering.
 3. Provide required preset configurations to accommodate all routing conditions.
 4. Provide automatic microphone mixing and proper mix-minus routing systems where multiple installed microphones are utilized.
 5. All video source inputs are to include audio support, unless otherwise noted. All audio associated with video is to follow video source routing. Where identified, provide audio breakaway from video programming.
 6. Provide separate equalization and dynamic processing for speech and playback source inputs. Provide separate volume control(s) for speech and playback sources, including volume up/down and mute.
 7. Provide limiting on all drivers.
 8. Once a room has been properly equalized for a flat response, if microphone feedback issues occur during initial testing, provide dynamic feedback equalizer filters with fixed notches for microphone signals. Dynamically assigned feedback filters are to reduce filter depth and return to a flat state once feedback has been addressed.
 9. Ensure all playback source output within room is within 1.5 dB of one another when source output level is identical.
 10. Use available DSP processing algorithms as required to optimize audio performance in all spaces.

11. Audio and Video Conferencing Requirements:
 12. Provide Acoustic Echo Cancellation and Noise Reduction at individual microphones for any room utilizing audio or video conferencing system(s).
 13. Coordinate with District regarding audio routing to recording computers.
- B. Video Switchers, Processors, and Extenders
1. Video systems are to be configured to output the highest resolution available for the specified screen aspect ratio.
 2. EDID signals are to be managed throughout system. Where EDID management is not available, utilize EDID emulators.
 3. Where twisted-pair video transmitters and receivers are utilized, perform distance compensation adjustments as required to achieve an image that is equivalent to the original signal.
 4. Where possible, supply DC power remotely (via PoE or direct DC current) to video transmitters and receivers from equipment rack location(s) in an effort to avoid unnecessary power supplies within the room(s) served.
 5. Coordinate with District regarding which video source(s) shall be routed to the recording computer in each Classroom.
 6. Video switching shall be set-up and managed via virtual switching appliance hardware device. Training shall include dashboard set-up and training for appliance to allow District to make adjustments and troubleshoot encoder and decoder end-devices remotely.
- C. Control Systems
1. Coordinate with the District and Consultant regarding specific graphical control interface requirements. This includes individual system functional requirements, Control Panel graphic appearance, page hierarchy, and other control interface parameters. The control interface design should be uniform in look, feel, and functionality across all spaces and systems throughout the project, unless otherwise noted in this specification section or directed by the District.
 2. Coordinate with District regarding level of IP-based system status notification required for audiovisual system(s). This may include, but is not limited to equipment failure notification, power failure notification, temperature level notification, after hours system use notification, room use and scheduling requirements, and digital signage display status.
 3. All control system programming is to be provided by a programmer certified by the manufacturer of the control system to be provided.
 4. Provide software necessary to operate and program audiovisual system components. The software is to be provided by the manufacturer(s) of system components.
 5. One Button Studio Cameras shall route to Video Production Switcher over HDMI for camera inputs to be switched via video production switcher.
 6. Control Panels:
 - a. The AV Contractor is to submit Control Panel pages and layouts to the District and Consultant in an interactive format prior to implementation. This interactive format is to emulate functionality, page hierarchy, and other interactive design parameters.
 - b. Control Panel pages and language is to be easy to understand for non-technical users. Technical terms not commonly used outside of the audiovisual industry are to be avoided whenever possible.
 - c. Coordinate with District about which Control Panel functions shall be password protected.
 - d. Provide ample time for Control Panel review in order to address District-requested changes without negatively impacting the installation schedule. Provide, at no additional charge, reprogramming of control system components at District's request for a full (30) days after system acceptance.

- e. DSP Audio presets are to be recalled seamlessly in the background as a result of source selection and intuitive control options.
 - f. Coordinate with other divisions as required to incorporate control of other room systems within the Control Panel user interface, including, but not limited to:
 - 1) Mechanical/HVAC
 - 2) Lighting/Shades
 - 3) Electrical systems
 - g. At a minimum, all Control Panel user interfaces are to include the following control parameters:
 - 1) Master audiovisual system On/Off control, including prompt at shutdown asking user "Are You Sure?" with "Yes" and "No" buttons to prevent accidental shut down.
 - 2) In rooms where there is more than a single display, provide On/Off control for individual displays
 - 3) For rooms with video projectors, provide a message during power-up on Control Panel display indicating "The Projector is Powering Up. Please Wait..." until video projector is fully operational.
 - 4) For rooms with video projectors, provide a message during power-down on Control Panel display indicating "The Projector is Powering Down. Please Wait..." until video projector is fully shut down.
 - 5) Separate speech and playback volume controls
 - 6) Source selection is to be provided for individual displays, unless otherwise noted in this specification section
- D. Network Data Coordination
- 1. Coordinate with District regarding desired level of audiovisual network and other data network integration. If no interoperability is desired, the AV Contractor is to create an independent network for audiovisual equipment as required.
 - 2. Contractor shall set-up and deploy Crestron XiO Cloud services for remote deployment, management, and monitoring to all AV devices. This shall include, but is not limited to, AV device monitoring, equipment failure alerts, system use data, remote and scheduled power cycling, and any other function required by District. Coordinate with District for specific requirements.
- E. Classroom Type Rooms
- 1. Default routing –Classroom
 - a. Instructor computer content view routes to projector room and lectern confidence monitor
 - b. When laptop HDMI is plugged in, all projector switches to laptop input
 - 2. Control Panel Programming
 - 1) Refer to default routing above for default routing
 - 2) "VOLUME CONTROL" button
 - 3) "POWER ON/OFF" button
 - b. Sources
 - 1) "INSTRUCTOR COMPUTER" button
 - 2) "LECTERN HDMI" button
 - 3) "LECTERN USB-C" button
 - 4) "LECTERN DISPLAYPORT" button
 - 5) "DOC CAMERA" button
 - 6) "WIRELESS PRESENTATION" button
 - 7) "PROJECTOR ON/OFF" button shall allow user to turn on/off the selected display, where applicable.
 - c. When "AUDIO CONTROL" button is selected, Control Panel shall route to audio control page with volume sliders and mute buttons for each audio source.

- d. When "POWER OFF" button is selected, a prompt shall appear that asks, "ARE YOU SURE?" with "YES" and "NO" buttons.
- e. All Control Panel pages described above, with the exception of the startup page and power off page, shall include a main volume control slider and mute button.

3.5 PERFORMANCE SPECIFICATIONS

- A. Unless restricted by the published specifications of a particular piece of equipment which would prevent other devices from doing so, the following performance standards shall be met or exceeded:
 - 1. Audio Processing Equipment
 - a. Signal-to-Noise ratio (including crosstalk and hum): 75dB minimum
 - b. Total Harmonic Distortion (THD): 0.5% maximum from 20 Hz to 20 kHz
 - c. Frequency Response: Flat within 0.5 dB, 20 Hz to 20 kHz
 - 2. Video Processing and Routing Equipment
 - a. HDMI
 - 1) HDMI 2.0
 - 2) HDCP 2.2 Compliant
 - b. Analog Video
 - 1) Signal-to-Noise Ratio (peak to RMS), unweighted DC to 4.2 MHz: 45 dB minimum
 - 2) Crosstalk, unweighted DC to 4.2 MHz: 45 dB minimum
 - 3) Frequency Response (RGBHV): +/- 0.5 dB to 300 MHz
 - 4) Line and Field Tilt: 2% maximum
 - 5) Differential Gain: 3% maximum
 - 6) Differential Phase: 2 degrees maximum

3.6 VERIFICATION

- A. Make all adjustments and modifications necessary so that the system is operational and functions as intended herein.
- B. Make all adjustment and modifications necessary for proper system gain structure as detailed herein and per equipment manufacturers' instructions and recommendations. Mark settings of all variable controls to be preset using Avery Label self-adhesive "dots" or equivalent.
- C. Upon completion of the installation (prior to Acceptance Testing), the AV Contractor is to perform verification testing of all elements of the system as follows:
 - 1. General Performance Verification
 - a. All cable lines are to be tested for continuity, phase, shielding, proper labeling, and unreasonable signal loss.
 - b. All equipment is to be tested for proper operation.
 - 2. Video Performance Verification
 - a. Signal Level, Distortion, Hum and Noise
 - 1) For analog video signals, utilizing a NTSC video signal generator, vector scope, and waveform analyzer with the video signal set at 1 Volt P-P and 75% saturation, check that the video performance specifications as stated previously are met at all display devices from all source inputs.
 - 2) Utilizing a laptop PC with 1080P and WUXGA color graphics capability, check that the video performance specifications are met at the display devices from all applicable source inputs.
 - b. Level Balance
 - 1) Adjust all video equipment to produce the best image possible according to manufacturer's instructions. Ensure that horizontal sweep circuitry is

- not overdriven to the point of audible sweep frequencies are being emitted.
- 2) Adjust all video cameras, monitors and media players to produce the best image possible according to manufacturer's instructions.
 - 3) Adjust all video distribution amplifiers for unity gain of luminance and chrominance at the end devices.
3. Audio Performance Verification
- a. Upon completion of the systems testing, the AV Contractor is to adjust, and uniformly calibrate all gain adjustments of the audio systems and related system devices.

3.7 ACCEPTANCE TESTING

- A. After completing preliminary testing, the AV Contractor shall furnish District with a cover letter describing system performance, and a report documenting the results of the preliminary tests, along two (2) copies of "as-built" wiring diagrams of the entire system, including the connection numbers, and their locations. The receipt of this documentation will constitute the AV Contractor's acknowledgment that the installation is complete and conforms to this specification, and is ready to be reviewed and tested by the Consultant.
- B. Acceptance testing shall be performed by the Consultant with assistance from the AV Contractor after receipt of report described above. AV Contractor shall provide a capable technician familiar with the installed AV systems for (2) single eight-hour days.
1. AV Contractor shall coordinate all site, room, millwork, and equipment cabinet access with District as required to fully test and verify installation.
 2. The AV Contractor shall furnish a laptop with all manufacturer supplied configuration software necessary for communicating with the Audio DSP. A review of system settings may be required for either of the programmable units at the Consultant's request, and settings may be adjusted if necessary.
 3. AV Contractor shall furnish all tools, test equipment, source equipment (including audio and video sources), and materials required to make necessary repairs, corrections, and adjustments required.
 4. Further electrical and acoustical measurements may be performed at the discretion of the District. Such measurements may include sound pressure levels, uniformity of coverage, distortion, or other pertinent characteristics.
 5. The Control System interface programmer shall be available during final testing to address and respond to control system interface questions, preset recall configuration assumptions etc.
- C. If further adjustments or work are required after acceptance testing, continue work until the system is made acceptable and at no additional cost to the District.
1. If acceptance is delayed due to incomplete installation or programming, defects in or failure of equipment, or because the installation fails to meet the requirements of this specification, and additional site visits are required, AV Contractor shall retain the Consultant, at the Consultant's standard hourly rate, for any additional Consultant time and expenses required due to extension of the acceptance testing.

3.8 DOCUMENTATION

- A. Furnish all submittal documents as identified in Part 1 of this specification section.
- B. Furnish an Operations and Maintenance Manual prepared for the District's technical staff, in preferred District format(s) (i.e. USB flash drive, hard copies, etc.) containing the following sections:

1. Service Reference Cover Sheet: Provide a cover sheet with AV Contractor name, address, telephone number, and website information.
 2. System Operation Instructions: Step-by-step operating instructions for the basic day-to-day use of the system, including power activation, connection of source devices, adjustment of volume levels, selection of sources, etc. Include illustrations and references to individual equipment manuals as necessary.
 3. Equipment Manuals: Include copies of individual equipment operation manuals separated by tabbed dividers. Order manuals in nominal signal path order (i.e. sources first, amplifiers/loudspeakers last), followed by control system manuals, followed by miscellaneous manuals.
 4. Equipment List: List all system equipment by manufacturer and model.
 5. As-built Drawings: Provide "as built" functional diagrams. Hard-copies, if required, shall be in reduced 11"x17" foldouts in clear plastic binder sleeves. Fold and insert drawings so that drawing title is clearly visible at the front of the sleeve.
 6. Provide software programmable device configuration files to the District for the following:
 - a. Control Systems (Source code, including any interfaces and computer-based application files).
 - b. DSP Audio System (DSP system configuration files).
 - c. Store files on site in the system documentation binders as CD-ROMs in disk sleeves. Provide the files on (2) USB flash drives.
 7. Maintenance: Devices requiring routing maintenance (such as video projector filters or lamps) shall be listed along with procedures and schedules for maintenance of those items. If information from the manufacturer is inadequate or item is custom, provide the information necessary for proper maintenance. Include parts lists and schematics as available from the manufactures and for all custom items.
 8. Service and Warranty Information: Furnish a clear statement of the AV Contractor's guarantee for the system and contact information for on-call services. Include manufacturer's warranty statement for all equipment including actual expiration dates.
- C. Submit a draft copy of the Operations and Maintenance manual to the Consultant prior to acceptance testing.

3.9 TRAINING

- A. Training shall only occur after final acceptance by the Consultant, unless otherwise directed by the District. AV Contractor shall furnish a complete Operations and Maintenance Manual to each participant at the time of training.
- B. At a time designated by the District, furnish (8) hours of instruction to the District's designated personnel in the use and operation of the system. The instructor is to be fully knowledgeable and qualified in system operation. If required by District, training sessions shall be video recorded in a format designated by the District for archiving.
- C. Furnish one (1) technician to be present and assist the District at the first two (2) major uses of the system as directed by the District.

END OF SECTION

SECTION 28 0000 - GENERAL SECURITY REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes general administrative and procedural requirements for the Security Sections in Division 28 with the intent to supplement, not supersede, the requirements specified in Division 1.
- B. Project Description Overview:
 - 1. Refresh of existing B500 communications and security system
 - 2. Access Control and Video Surveillance System.
 - 3. The access control and Video Surveillance systems will be an extension of the campus system. Provide one additional video recording server to increase storage capacity in the B1900 building. This additional server will expand the campus system to accommodate all new cameras in B1500, B1800, the Amphitheater and B600
 - 4. This project to comply with the Security Master Plan dated May 4, 2018:
 - a. Contractor responsible for obtaining a copy of this from the Campus Public Safety Office.
 - 5. Provide system testing as detailed in Part 3.
- C. Related Sections:
 - 1. Section 07 84 00: Firestopping.
 - 2. Section 08 71 00: Door hardware.
 - 3. Section 26 00 00: All electrical specifications.
 - 4. Section 27 00 00: All telecom specifications.
 - 5. Section 28 05 13: Security System Cabling.
 - 6. Section 28 13 00: Access Control and Alarm Monitoring System.
 - 7. Section 28 23 00: Video Surveillance System.
- D. System Description:
 - 1. Addition to existing Lenel S2 access control system and video management software, see description above

1.2 REFERENCES

- A. Reference to codes and standards of technical societies, trade organizations and governmental agencies are for the latest edition published prior to submittal of the bid. Consider such codes or standards a part of this Specification.
- B. Codes: Perform Work in accordance with applicable requirements of the latest edition of governing codes, rules and regulations including but not limited to:
 - 1. National Electric Code (NEC), NFPA 70.
 - 2. California Code of Regulations (CCR) Title 24, California Building Standards Code Part 2, Basic Building Regulations and Part 3, California Electrical Code (CEC).
 - 3. Building Codes (IBC) - (UBC).
 - 4. Uniform Fire Code (UFC).
 - 5. National, State, Local and other binding building and fire codes.
 - 6. Local Authority Having Jurisdiction (AHJ).

- C. Standards: Perform Work and furnish materials and equipment in accordance with the latest editions of the following standards as applicable:
1. Underwriter's Laboratories (UL): Applicable listing and ratings:
 - a. UL 294: Access Control System Units.
 - b. UL 1076: Proprietary Burglar Alarm Units and Systems.
 2. National Fire Protection Association (NFPA):
 - a. NFPA 70 National Electric Code.
 - b. NFPA 101 Life Safety Code .
 - c. NFPA 730 Guide for Premises Security.
 - d. NFPA 731 Standard for the Installation of Electronic Premises Security Systems.
 3. Institute of Electrical and Electronic Engineers (IEEE).
 4. Telecommunications Industry Associations (TIA).
 5. Federal Communications Commission (FCC) – Part 15 and Part 68.
 6. International Organization for Standardization (ISO) – quality management systems.
 7. Campus security standards.
- D. For conflicts between contract documents and referenced codes or standards, comply with the more stringent.
- E. Definitions of Division 1: Apply to the Division 28 Security System Sections
- F. Additional Definitions: The following list of terms as used in this specification defined as follows:
1. **Contractor:** The term "Contractor" refers to the installation Contractor responsible for the furnishing and installation of all work indicated within this Specification.
 2. **Construction Manager:** The terms "Construction Manager" mean the Owner's appointed representative.
 3. **Furnish:** Used to mean purchase, supply, provide and deliver to the Project site, protect and provide interim storage and be ready for unloading, unpacking, assembly, installation, and similar operations in accordance with Manufacturer's Specifications.
 4. **Provide:** Furnish and install, complete and ready for the intended use.
 5. **Install:** Describes operations at project site including the actual unloading, unpacking, rigging in place, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protecting, cleaning, and similar operations.
 6. **Installer:** Contractor, Subcontractor or supplier using their own employees for construction activity related to their specified responsibilities. Installers are required to be an authorized Manufacturer's representative, experienced and qualified to provide, install, program, troubleshoot, train, warrant and service the systems in this section.
 7. **If Applicable:** That work required for construction completion at applicable locations, but is not necessarily shown or described in the Contract Documents.
 8. **As Necessary:** Work required for construction completion, but is not necessarily shown or described in the Contract Documents.
 9. **As Required:** Work required for construction completion, and is shown on the drawings or described in the project Specification.
 10. **Product:** The term "product" will mean any item of equipment, material, fixture, apparatus, appliance or accessory installed under this Division.
 11. **Governmental:** The term "governmental" means all municipal, state and federal government agencies.
 12. **UL/NRTL Listed:** Indicates that a product is listed to the applicable standard for which it will be used; the standard is typically written by UL or ANSI; the product testing can be done by any Nationally Recognized Testing Laboratory, such as UL or ETL.
 13. **Words in the singular:** will also mean and include the plural, wherever the context so indicates, and words in the plural will mean the singular, wherever the context so indicates.

- G. Abbreviations and Acronyms:
1. ACAMS: Access Control and Alarm Monitoring System.
 2. AHJ: Authority Having Jurisdiction.
 3. AoR: Area of Refuge.
 4. DGP: Data Gathering Panel (access control field panel).
 5. DMA: Door Management Alarm (door prop alarm annunciator).
 6. ECS: Emergency Communication System.
 7. FOV: Field of View.
 8. FPT: Functional Performance Test.
 9. IDS: Intrusion Detection System.
 10. IP: Internet Protocol.
 11. IT: Information Technology.
 12. MAC: Medium Access Control (Ethernet layer 2, used for device address).
 13. NICET: National Institute for Certification in Engineering Technologies (levels I to IV).
 14. NRTL: Nationally Recognized Testing Laboratory.
 15. OBVA: Object Based Video Analytics.
 16. OSDP: Open Supervised Device Protocol – access control standard.
 17. PDF: Portable Document Format by Adobe.
 18. PoE: Power over Ethernet.
 19. SOT: System Operational Test.
 20. TIA: Telecommunications Industry Association.
 21. TCP/IP: Transmission Control Protocol/Internet Protocol.
 22. UL: Underwriters Laboratory (standards writing and testing organization).
 23. UPS: Uninterruptable Power Supply.
 24. VSS: Video Surveillance System.

1.3 PRICING

- A. Provide add and deduct pricing for all specified components.

1.4 ADMINISTRATIVE REQUIREMENTS

- A. Provide a project manager/engineer:
1. For the duration of the project to coordinate the security system Work with other trades.
 2. Coordination services, procedures and documentation responsibility include at a minimum, the items listed in this section.
 3. Obtain copies of shop drawings for equipment provided by others that require security connections or interface with the security system Work.
- B. Request for Information (RFI):
1. Thoroughly review the contract documents prior to submitting an RFI, including drawings and specifications:
 - a. Attach 8 1/2" x 11" copies of relevant documents to clarify the issue.
 2. Submit RFI's according to the General Contractor's procedure.
- C. Weekly Status Reports:
1. Prepare weekly status reports throughout the entire course of the project containing the following information:
 - a. Progress during prior week.
 - b. Work completion expected during the upcoming week.
 - c. Delivery dates for equipment.
 - d. Status for each device requiring coordination with other subcontractors.
 - e. Summary of the information owed to the Contractor, who is responsible for providing the information, and due date for the information.

- D. Role of the Engineer:
 - 1. Provide interpretation and clarification of project contract documents.
 - 2. Process and reply to relevant Requests for Information (RFI).
 - 3. Act as an interface between the Contractor and the Owner.
 - 4. Observe the Work for general compliance with the Contract Documents.

- E. Permits and Inspections:
 - 1. Obtain and pay for permits and inspections required for the Work.
 - 2. Furnish materials and workmanship for this Work in conformance with applicable legal and code requirements.
 - 3. Perform tests to demonstrate conformance with the Specifications.
 - 4. Obtain review from compliance officials responsible for enforcement of applicable codes and regulations.

1.5 CONTRACTOR QUALIFICATIONS

- A. A current, active, and valid C7 or C10 California State Contractors License.
- B. Contractor must be a certified dealer for the products specified.
- C. Minimum of 5 years' experience in the installation and service of the specified systems.
- D. Minimum five completed projects similar to scope and cost.
- E. The project manager and lead technicians shall have a minimum 5 years of engagement in projects with similar scope and systems.
- F. Evidence of lead technicians' qualification for the project in the form of current manufacturer training certification for every system specified.
- G. Contractor must maintain a service office within a 50-mile radius of the project to provide warranty service.

1.6 SUBMITTALS

- A. General:
 - 1. Provide submittals according to the Division 01 Submittal Procedures Section as well as the following minimum requirements

- B. Submit with Bid:
 - 1. Project Manager and Lead Technician(s) Resumes:
 - a. Indicate project role, years of experience, product certifications and training.
 - b. List similar projects the individual performed the role proposed for this project.
 - 2. Contractor Certification:
 - a. Provide manufacturer certification letters of major system components.
 - b. Provide certification letters of lead Technician.
 - c. State License Type and Number.

- C. Product Data
 - 1. Provide submittal electronically using Portable Document Format (PDF).
 - 2. Each specification section shall be in a separate file with:
 - a. Cover sheet describing the section, contractor name, project name and date of submission.
 - b. Table of contents:

- 1) Order products in the file in the same order as listed in the specification.
 - c. List all products used in a section, even if the same produce is duplicated in other sections.
 3. Products with battery backup power:
 - a. Provide calculations that show standby power capacity complies with the specification.
 - b. List the load power.
 - c. List the number of batteries, or battery packs along with their capacity.
 4. Video storage devices:
 - a. Provide manufacturer calculations showing the storage capacity using the submitted cameras, with the specified resolution and recording rates.
 5. Resubmittals:
 - a. Resend the entire submittal with the updated product information.
 - b. Update the table of contents to indicate the products that have changed.
 - c. Add the resubmittal date to the submittal cover page.
 - D. Shop Drawings:
 1. Prepare shop drawings from GC provided CAD drawing.
 - a. Include field labeling for cables, panel, ports, and devices.
 - b. Point-to-Point wiring diagrams for field panels, devices, power supplies, and relays.
 2. Optional use of Engineer's AutoCAD/Revit files:
 - a. Engineer will provide AutoCAD/Revit files, upon receipt of signed shared file release agreement.
 3. Submit the shop drawings for review and approval prior to the installation of equipment.
 - E. Security System Labels
 1. Submit labeling scheme in word document for each field device prior to permanent labeling for review and approval by engineer.
 - F. Contractor Qualifications:
 1. Project Manager and Lead Technician(s) Resumes:
 - a. Indicate project role, years of experience, product certifications and training.
 - b. List similar projects the individual performed the role proposed for this project.
 2. Contractor certification:
 - a. Provide manufacturer certification letters of major system components.
 - b. State license type and number.
 - G. Training Materials:
 1. See Training below.
- 1.7 CLOSEOUT SUBMITTALS
- A. As-Built Drawings:
 1. Drawings shall be in current AutoCAD or Revit format using the same version as the architect.
 2. The drawings shall reflect all of the changes made throughout the project, including addenda, RFI responses, change orders, and changes due to site conditions.
 3. Use commonly recognized drafting techniques that follow the standards of AutoCAD/Revit.
 4. Follow the drafting standards, formats and guidelines of the architect showing:
 - a. All security devices, field panels, racks and computers.
 - b. Symbol legend.
 - c. Cable routing.
 - d. Cable labeling.

5. Provide elevation drawings showing device installation details.
 6. Provide block riser diagram showing device and subsystem interconnections.
 7. Provide one set of full-size sheets (actual size specified by architect).
 8. Provide an electronic copy of the drawings in AutoCAD/Revit and PDF formats:
 - a. Provide files electronically. Place the files within a folder labeled with the project name, contractor name and date.
 9. Submit the hard and soft copies of the project documentation within 30 days of completion.
- B. Operation and Maintenance Manuals (O&M Manuals)- for each system provide:
1. Provide the Owner with 2 hard copies of system manuals, and 1 electronic copy in PDF.
 2. Hard copy manuals shall be in adequately sized three-ring binders, clearly labeled on the spine.
 3. Provide a PDF copy for the Design Engineer.
 4. O&M Manuals shall contain the following:
 - a. Cover sheet with Security Contractor name, address, telephone number and web address.
 - b. Table of contents: listing each manual and drawing.
 - c. System Operation Instructions:
 - 1) Step-by-step operating instructions for the basic day-to-day use of the system including system startup, and system shutdown.
 - 2) Include illustrations and references to individual equipment manuals as necessary.
 - d. Equipment Manuals: include copies of individual equipment operation manuals
 - e. Equipment List: list all system equipment including, field/control panels, card readers, cameras, workstations, monitors, storage devices, intercoms, intrusion alarm devices and duress alarms.
 - f. As-built Drawings:
 - g. Provide software programmable device configuration files for all systems.
 - h. The FPT test documents in hard copy and PDF.
- C. Software
1. Provide all necessary software, installation codes, serial numbers, installation instructions, and documentation so that a technician trained and certified by the equipment manufacturer and authorized by the Owner, can reinstall and modify the software.
- D. Provide all warranty documentation.
- E. Provide all maintenance contract documentation.
- 1.8 QUALITY ASSURANCE
- A. General:
1. Provide new and unused materials, equipment, and parts.
 2. Only use products and applications listed in the associated security Sections on the project.
- B. Substitutions:
1. Substituted products must be of equivalent design, construction, and performance.
 2. Include substituted product cut sheet in product data submittal and stamp or mark clearly at top of page "SUBSTITUTE".
 3. Ensure that the entire system operates as specified with substitution.

1.9 CYBER SECURITY

- A. Maintenance contract to include a Software Support Agreement (SSA) from the Security System manufacturers requiring periodic software updates and patches that address known vulnerabilities.
- B. Update all Security Systems software and firmware to the most current version.
- C. Passwords:
 - 1. Coordinate with the Owner on the password strategy.
 - 2. For each system, provide passwords for all administrative levels that will enable the trained and certified representative to make all administrative and configuration changes.
 - 3. All factory passwords are to be changed.
 - 4. Each device shall have a unique password:
 - 5. Treat all passwords as confidential and security sensitive:
 - a. Provide the passwords directly to the Owner's designated System Administrator.
 - b. Provide a transmittal to the GC indicating the date and the name of the person receiving the passwords.

1.10 DELIVERY, STORAGE AND HANDLING

- A. Storage:
 - 1. Store materials in a secure, clean, dry, ventilated space free from temperature extremes.
 - 2. Maintain factory wrapping or provide a heavy canvas/plastic cover to protect units from dirt, water, construction debris, and traffic.
 - 3. Provide heat where required to prevent condensation or temperature related damage.
 - 4. Do not accept delivery of materials until the above storage is available.
- B. Handling:
 - 1. Handle in accordance with manufacturer's written instructions.
 - 2. Prevent internal component damage, breakage, denting and scoring.
 - 3. Do not install damaged equipment.
 - 4. Replace damaged equipment and return equipment to manufacturer.

1.11 WARRANTY

- A. Provide a 1-year parts and labor service warranty according to the Conditions of the Contract, and Division 01:
 - 1. Use the more stringent warranty requirements if there is a conflict with Division 01.
 - 2. Warrant all installed Work and components to be free from defects in design and workmanship.
 - 3. Warranty shall start on final acceptance of system by the Owner including:
 - a. Successful completion of all functional performance testing.
 - b. Completion of all punch list items.
- B. Provide 24-hours per day, 7-days per week service response:
 - 1. Provide telephone technical support response requests within 2 hours.
 - 2. Provide technical repair personnel onsite within 4 hours of service request.
 - 3. If repairs are not complete within 8 hours of the service request, the Owner reserves the right to escalate to a higher level of service support.
 - 4. If the system is not operational with at least loaner components, within 12 hours of the service request, the Owner reserves the right to require:

- a. Continuous 24-by-7 on-site work effort by qualified technical staff until the system is operational.
- b. Provide a written action-plan, signed by the highest level of local management, describing the course of action and the service escalation plan.
5. Complete repairs within 48 hours after service request:
 - a. The Owner reserves the right to require on-site manufacturer support if the repairs exceed 48 hours.
- C. Provide qualified technical repair personnel familiar with the Work on this project:
 1. Perform service work using factory certified technicians.
 2. Provide a loaner component to make the system operational, if a component is not repairable in the field.
 3. Provide the Owner a report for every service call detailing:
 - a. Work completed.
 - b. Cause of failure.
 - c. Outstanding issues.
 - d. Time and date of request and completion of repair.
 4. Conduct warranty repairs at the job site. If an on-site repair violates manufacturer's warranty, provide:
 - a. Substitute systems or equipment, acceptable to the Owner, for the duration of off-site repairs.
 - b. Provide substitutions and labor under the warranty.
- D. Transfer extended manufacturer warranties to the Owner.

1.12 TRAINING

- A. Provide user training for the Owner's designated staff:
 1. Coordinate with Owner on training class content to accommodate the Owner's operational requirements:
 - a. Schedule coordination meeting fourteen (14) business days in advance of first training class.
 2. Provide 6 hours of system operation training:
 - a. Content to include:
 - 1) Step-by-step operating instructions for day-to-day use of the system.
 - 2) High-level system architecture and sub-system integration as it affects system operation.
 - 3) System startup and shutdown.
 - 4) Include illustrations and references to individual equipment manuals as necessary.
 3. Provide 8 hours of system administration training session up to 4 people:
 - a. Content to include:
 - 1) High-level system architecture and sub-system integration as it affects system operation and administration.
 - 2) All system administration commands for each subsystem.
 - 3) Discuss system operation best practices in conjunction with the Owner's operational requirements.
 4. Coordinate with the Owner on scheduling the classes. The Owner reserves the right to schedule classes that accommodate their operational requirements.
- B. Provide Training Manuals:
 1. Provide one hardcopy, bound manual for each student and two spare copies.
 2. Provide the Manuals electronically in PDF.
 3. Training Manuals Shall Include:

- a. Title page, with Manual subject material, date, Owner's name and Owner approved confidentiality notice.
 - b. Table-of-contents.
 - c. Support phone number.
 - d. Support call in procedure.
 - e. Contents to support the above training sessions.
4. Submit training manuals for approval seven (7) days prior to training classes.

PART 2 - PRODUCTS

2.1 GENERAL

- A. The material and equipment specified are the minimum acceptable quality and performance:
 1. They are to function as components of the overall integrated system.
- B. Provide materials permanently labeled with the manufacturer's name, model and serial number.
- C. Use standard, regularly manufactured, materials, software, and equipment:
 1. Do not provide custom designed products for this project.
 2. Provide systems and components thoroughly tested and proven in actual use.
 3. Provide subsystems of one manufacturer.

2.2 SURGE PROTECTIVE DEVICES (SPD):

- A. Provide self-restoring SPDs.
- B. Data/signal line SPDs:
 1. Utilize silicon avalanche diode and MOV components.
 2. Provide SPD with verified transmission rate, without signal attenuation, and is compatible with protected device data requirements.
 3. Provide SPDs with manufacturer recommended clamp voltage for the protected device.
 4. NRTL listed to UL 497A for telephone lines.
 5. NRTL listed to UL 497B for data and signal line circuits.
- C. Power line SPD:
 1. Suppression between L-N, L-G, N-G.
 2. Maximum continuous operating voltage 125 VAC.
 3. Status indicator light(s).
 4. NRTL listed to UL 1449.
- D. Manufacturers:
 1. DITEK.
 2. Edco.
 3. ITW Linx.

2.3 TAMPER RESISTANT HARDWARE

- A. Provide Torx Pin-Head tamper resistant screws to secure hardware in public spaces:
 1. Provide screws with corrosion resistance.
 2. Match finish color for screws used in specialty metal surfaces.
 3. Provide 4 screwdrivers for removal of tamper resistant screws.

2.4 LABELS

- A. Manufacturer:
 - 1. Brady
 - 2. Thomas and Betts

- B. Wire and Cable Labels:
 - 1. Self-laminating adhesive laser labels.
 - 2. Machine printable with a laser printer.
 - 3. Color: white with black lettering
 - 4. Manufacturer:
 - a. Brady wire marking labels WML-211-295 and WML-311-292
 - b. Write-on labels are unacceptable.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Conditions: Verify existing conditions are acceptable for product installation in accordance with manufacturer's instructions.

- B. Pathways: Verify proper installation of pathways and supporting devices:
 - 1. Remove temporary supports and devices.

- C. Field Measurements: Verify dimensions prior to installation.

3.2 FIELD QUALITY CONTROL

- A. Staffing:
 - 1. Provide a qualified supervisor who is in charge of the Work and who is present at the job site at times Work is being performed.
 - 2. Perform the Work using skilled technicians under the direction of the supervisor.
 - 3. Supervise the work force executing the Work.
 - 4. Perform the installation within the restraints of the construction schedule.
 - 5. Do not change the supervisor during the project without prior written approval from the Owner.

- B. Inspection:
 - 1. Perform inspection after installation.
 - 2. Keep areas of work accessible and notify code authorities, or designated inspectors, of work completion released for inspection.
 - 3. Document completion and inspection as required.

3.3 INSTALLATION

- A. Perform this work in accordance with acknowledged industry and professional standards and practices.

- B. Provide a complete, operating system. Include:
 - 1. Specified devices, components, accessories, and interconnecting wiring for a complete system.

- C. Coordinate commercial and emergency power requirements with Division 26 and Division 27 contractors.
- D. Manufacturer's Instructions:
 - 1. Install all equipment per manufacturer's recommendation.
- E. IT coordination:
 - 1. Coordinate with the Owners IT staff on IP assignments, and cyber security requirements.
- F. Surge Protective Devices (SPD):
 - 1. Install SPDs to protect:
 - a. The 120 VAC line power to the security equipment.
 - b. The ACAMS, and VSS devices located outside of a building connected via metallic signal and/or power lines.
 - 2. When security devices are connected to exterior metallic conductors, including underground metallic conductors, install SPDs at both ends of the conductor.
 - 3. Match SPD equipment to the protected equipment, including wire sizes, operating voltages, currents and number of conductors.
 - 4. Install SPDs with hardwired low-voltage circuit lead lengths (conductor/wire distance) a minimum of 3 wire feet, (unless otherwise specified by manufacturer) and that the referenced ground connections are of a lesser distance (conductor/wire length).
 - 5. All required surge protection must be installed, according to manufacturer instructions, prior to applying power or connecting signaling conductors to electronic components.
- G. Labeling:
 - 1. Wire and Cable
 - a. Identify wire and cable clearly with permanent machine-generated labels:
 - 1) Attach labels to cable jacket.
 - 2) Do not label individual conductors.
 - b. Show cable ID on the associated field or shop drawings.
 - c. Positional labels so they are clearly visible without the need to remove wire management or other obstructions.
 - d. Label cables at both the control equipment and the device location.
 - 2. Cable Label Format
 - a. Contact engineer for labeling format prior to labeling.
 - b. Remove labels with unapproved format.
- H. Conduits Boxes, Panels, and Enclosures:
 - 1. Identify conduits and boxes with a unique paint color.
 - 2. Do not write on boxes or conduit identifying them as security system infrastructure.
- I. Finishes:
 - 1. Coordinate with the architect color and finishes with all devices and equipment in public areas.
- J. Provide as-built drawings.
- K. Coordinate with Owner on passwords for systems:
 - 1. Replace all default passwords.
- L. Provide backup copy of all software.

3.4 REPAIR/RESTORATION

- A. Replace or repair damaged work.
- B. Repaint surfaces altered during installation of the security system to match previous conditions.

3.5 CLEANING

- A. Remove temporary coverings and protection of adjacent work areas. Remove unused products, debris, spills, or other excess materials. Remove installation equipment.
- B. Leave finished work and adjacent surfaces in neat, clean condition with no evidence of damage.
- C. Repair or replace damaged installed products.
- D. Legally dispose of debris.
- E. Clean installed products in accordance with manufacturer's instructions.

3.6 TESTING

- A. Perform testing below to demonstrate system operation, performance and workmanship:
 - 1. Submit test plan and test documents 10 business days prior to scheduled testing:
 - a. Testing shall not begin without an Owner approved test plan.
 - b. Design test plan to minimize impact on Owner ongoing operations.
 - 2. The Owner or the Owner representative will witness testing.
 - 3. Malfunction or defective equipment shall be replaced or repaired, then retested until all equipment in the system is fully operational.
 - 4. Provide sufficient staff and communication equipment to perform testing without relying on the Owner's staff or communications equipment.
 - 5. The cost for retesting due to high failure rate or noncompliance with contract documents may be borne exclusively by the contractor at the Owner's representative's discretion.
 - 6. Upon the successful completion of each test, the test documents shall be signed by the contractor and Owner witnesses, scanned and submitted as part of the final system documentation package.
- B. Functional Performance Test (FPT):
 - 1. Prior to the FPT, the system must be pretested:
 - a. All devices must be tested.
 - b. All subsystem integration must be tested.
 - c. All deficiencies must be corrected prior to the start of the FPT.
 - 2. Testing shall be comprehensive:
 - a. All equipment and software functions shall be tested for every device, field panel, network device, computer and auxiliary equipment.
 - b. Subsystem integration shall be tested such as camera call-up.
 - c. Mechanical operations of the doors must be tested to ensure that doors with electronic security properly close and latch – report mechanical door problems to the general contractor.
 - d. Cameras are checked for proper field of view and are in focus.
 - e. An image of all cameras will be recorded in the test documents.

- f. Review the video recorder settings ensuring that they are within contract specifications.
 - g. Review the video recorder storage to ensure that the recorder will meet contract specification storage requirements.
 - h. Review network switch settings for all switches, provided by the security contractor, to ensure that they are within contract specifications for performance and IT security.
 - i. Review the ACAMS server and software to ensure they meet contract specifications.
 - j. Review the IDS to ensure the system meets contract specifications.
3. The FPT may be terminated at any time due to a high failure rate or noncompliance with the contract documents at the discretion of the Owner's representative:
- C. System Operational Test (SOT):
1. Upon completion of the FPT and prior system acceptance, demonstrate that the system operates in a stable and reliable fashion.
 2. Perform this test over a 72-hour period.
 3. The test shall be in the operational environment with all subsystems, field panels and devices operational.
 4. The entire system shall operate error free for the duration of the test.
 5. If there are faults, document and repair them before restarting the test from the beginning of the test period.

END OF SECTION 28 00 00

SECTION 28 0513 - SECURITY SYSTEM CABLING

PART 1 - GENERAL

1.1 SUMMARY

- A. General: Furnish engineering, labor, materials, apparatus, tools, equipment, transportation, temporary construction and special or occasional services as required to make a complete working security system installation, as described in these specifications.
- B. Section Includes:
 - 1. Wire and cable.
- C. Related Sections:
 - 1. Consult other Sections, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.
 - 2. Section 28 00 00 Basic Security Requirements: includes general project requirements, submittal formats, installation, and warranty requirements.
 - 3. Section 26 05 33 Conduit: includes pathway types in different areas of the project.

1.2 SUBMITTALS

- A. Product Data: Submit product information, including:
 - 1. Cable Description and Use.
 - 2. Jacket Rating.
 - 3. Outside Diameter (of the overall wire or cable).
 - 4. Manufacturer.
 - 5. Part Number.

1.3 MAINTENANCE MATERIAL

- A. Spare Parts:
 - 1. Refer to Section 28 00 00 for spare part requirements.
 - 2. Provide 2 (unless otherwise specified) of the following patch cables:
 - a. Wet Environment patch cables of each size provided.
 - b. Interior camera, patch cables.
 - c. Security patch panel, patch cables.

PART 2 - PRODUCTS

2.1 WIRE AND CABLE

- A. General:
 - 1. Provide required wire and cable sized to allow for voltage drop on long runs and effectively shielded as required to allow the routing of 12 & 24V power and video signal cable in the same conduit without interference or signal noise.
 - 2. Provide U.L. approved cable for its intended application and meet manufacturer's recommendations for the components connected.
 - 3. Comply with NEC, and local building code, cable requirements for each cable's application.

- a. All UTP cable will be provided by Division 27 contractor.
- B. Access Control & Alarm Monitoring System cable:
 - 1. Provide cable and wire recommended by manufacturer, and as required by the current NEC, and local building code.
 - 2. Provide cable and wire sized to accommodate the conductor voltage drop, device current draw, and distances for the cable runs.
- C. Video Surveillance System cable:
 - 1. Provide cable and wire recommended by manufacturer, and as required by the current NEC, and local building code.
 - 2. Provide cable and wire sized to accommodate the conductor voltage drop, device current draw, and distances for the cable runs.
 - 3. For UTP structured cabling, refer to Section 27 00 00 for cable and installation requirements.
 - 4. Data drops by Division 27.
- D. Patch Cables:
 - 1. Provide pre-manufactured patch cables to connect security systems to data communication jacks.
 - 2. Provide patch cables certified for their specific use, and meet applicable industry standards.
 - 3. Provide cable lengths as necessary to neatly route cables through cable management systems and other cable organization systems.
 - 4. Provide connectors as required for proper termination.
 - 5. Provide boots for connectors to prevent snagging.
 - 6. Coordinate with Owner's IT representative on cable color requirements.

PART 3 - EXECUTION

3.1 GENERAL

- A. Refer to Section 28 00 00 General Security Requirements.
- B. See Section 28 00 00 for Security System Label requirements.
- C. Coordinate installation activities with the following Divisions or groups:
 - 1. Division 8 – Door hardware, doors, and frames.
 - 2. Division 14 - Elevators
 - 3. Division 26 – Electrical power and pathways.
 - 4. Division 27 – Telecom voice and data cabling.
 - 5. Authority Having Jurisdiction for life-safety requirements.
 - 6. Fire alarm contractor.
 - 7. CLPCCD IT group.

3.2 EXAMINATION

- A. Conditions: Verify existing conditions are acceptable for product installation in accordance with manufacturer's instructions.
- B. Pathways: Verify proper installation of pathways and supporting devices:
 - 1. Remove temporary supports and devices.

C. Field Measurements: Verify dimensions prior to installation.

3.3 INSTALLATION

A. Label cables in accordance with Section 28 00 00

B. Horizontal Cable Installation and Routing:

1. Provide continuous and splice-free wire or cable for the entire length of the run from origination to termination.
2. Contractor will provide separate pathways for security cabling within the structured cabling system, such as cable tray, basketway, cable hangers, etc.:
 - a. Do not fasten or attach cables to other building infrastructure (such as ducts, pipes, conduits, ceiling support wires, wall studs, etc.), or other non-approved pathway systems.
3. Place and suspend cables and conductors during installation and termination in a manner to protect them from physical interference or damage.
4. Place cables with no kinks, twists, or impact damage to the sheath:
 - a. Replace cables damaged during installation or termination at no additional cost.
5. Route cables at 90-degree angles, allowing for bending radius, along corridors for ease of access.
6. Do not exceed manufacturer's limits for pulling tension.
7. Do not use cable-pulling compounds for indoor installations.
8. Route cables under building infrastructure (such as ducts, pipes, conduits, etc.) so the installation results in easy accessibility to the cables in the future. Do not route cables over building infrastructure.
9. Dress and secure cables to preclude stress and/or deformation.
10. Install shielded wiring or route in separate raceways as recommended by the manufacturer.
11. Place cables 6", minimum, away from power sources to reduce interference from EMI
12. Do not run signal wire and cable in parallel to power (120VAC).
13. Make connections to screw-type barrier blocks with insulated crimp-type spade lugs. Size lugs properly to assure high electrical integrity, i.e., low resistance connections.
14. Follow manufacturers recommended guidelines for installation.

C. Vertical Cable Installation and Routing:

1. Secure wire and cable run vertically in conduit for continuous distances greater than thirty (30) feet at the vertical run terminations.
2. Secure non-UTP cables using screw-flange nylon cable ties or similar approved devices, Thomas and Betts or equivalent.

D. Ground the cable shields as recommended by the hardware manufacturer:

1. Ground cable shields at the field panel feeding the device or sub panel and insulated from ground at the termination end of the cable.

3.4 CABLE SUPPORT

A. Horizontal Support:

1. Concrete and Metal Construction (Above Ceiling):
 - a. Provide separate and dedicated cable support system for security cable runs.
 - b. Anchor cable support system to structural ceiling.
 - c. Support and tie cables at a maximum of 5-foot intervals.
2. Wood Construction (above ceiling and no ceiling):
 - a. Support cable utilizing appropriately sized drive rings or "D" rings.
 - b. Fasten rings to structural ceiling.
 - c. Install drive rings at approximately 5-foot intervals.

- d. Route cable through drive rings and cable tie at 10-foot intervals, or every other drive.
- 3. Vertical cable on floor space not in riser system:
 - a. Route cable from below suspended ceiling devices to above ceiling when possible.
 - 1) Provide conduit and firestopping for cable routed in fire rated wall assemblies.
 - 2) Provide conduit for cable routed from below ceiling devices to above ceiling on concrete tilt up style walls.
 - b. Cable routed vertically from devices with no suspended ceiling:
 - 1) Provide conduit stub from device junction box to 14 feet A.F.F minimum.

END OF SECTION 28 0513

SECTION 28 1300 - ACCESS CONTROL AND ALARM MONITORING SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

- A. General: Furnish engineering, labor, materials, tools, equipment, programming, and transportation as required to make a complete working Access Control and Alarm Monitoring System (ACAMS) as described in the contract documents.
- B. Section includes:
 - 1. Access control field panels, and card readers.
 - 2. Door contacts and request to exit devices.
 - 3. Emergency door release devices.
 - 4. Interface to electric door hardware.
 - 5. Integration and connections between security subsystems.
 - 6. Lock power supplies.
 - 7. Device power supplies.
 - 8. Uninterruptable power supplies.
- C. Products furnished but not installed under this section:
 - 1. None.
- D. Related Sections:
 - 1. Section 07 8 400: Firestopping.
 - 2. Section 08 71 00: Door Hardware.
 - 3. Section 26 00 00: Electrical.
 - 4. Section 27 00 00: Communications.
 - 5. Section 28 00 00: General Security Requirements.
 - 6. Section 28 05 13: Security System Cabling.
 - 7. Section 28 23 00: Video Surveillance System.

1.2 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. See Section 28 00 00.
- B. Definitions:
 - 1. See Section 28 00 00.

1.3 SYSTEM DESCRIPTION

- A. Overview:
 - 1. The ACAMS consists of the field panels, card readers, locks, door operators, outputs, and alarm initiating devices.
 - 2. The ACAMS will be based on the Lenel S2 system (LPC Campus Standard)
 - 3. The ACAMS components communicate to the existing server and workstations over the Owner's LAN.
 - 4. Integrate the ACAMS to the Video Surveillance System (Section 28 23 00).
 - 5. Provide all labor, equipment, tools, services, and software (excluding specified products provided by others) required to make the ACAMS fully operational and complete.

- B. Access Control and Alarm Monitoring System:
 - 1. This project is an extension of the Owner's existing ACAMS (Lenel S2).

- C. OSDP compliance:
 - 1. The card readers and DGP communication to the card readers must be compliant with the open standard, developed by the Security Industry Association (SIA), the Open Supervised Device Protocol (OSDP) latest version unless otherwise noted.

- D. ACAMS commissioning:
 - 1. Provide database to support a fully operational ACAMS.
 - 2. Coordinate meetings with Owner's physical security representative to develop ACAMS database and graphical UI content.
 - 3. Obtain Owner approval of database content prior to loading database.

- E. Coordinate with Fire Alarm Contractor.
 - 1. Interface ACAMS to Fire Alarm for compliance with life safety code requirements.
 - 2. Connect ACAMS to Fire Alarm relay(s).

- F. Alarm Notification:
 - 1. Provide an Owner configurable, priority driven, alarm notification capability for ACAMS alarms.
 - 2. Graphical Maps:
 - a. Provide a graphical representation of the alarm type and its location.
 - b. Provide controls on the maps to control locks and door/gate operators.
 - c. Provide controls to call-up video cameras in the area.
 - d. Provide map navigation so operator can intuitively select from the overall site display down to the individual map showing alarms and controls for the area of interest.
 - e. Coordinate with Owner on map navigation simplicity and the amount of detail in each map.

- G. Fault Monitoring:
 - 1. Provide alarm notification of conditions that affect the health of the ACAMS.
 - 2. Log ACAMS alarms in the system transaction log.
 - 3. Data Gathering Panels (DGP):
 - a. Input wire faults.
 - b. AC power loss.
 - c. Battery fault.
 - d. Communication fault.
 - 4. UPS faults:
 - a. AC power loss.
 - b. Low battery.
 - c. Battery charging fault.

- H. Tamper Monitoring:
 - 1. Provide tamper switches for:
 - a. DGP, security system equipment, and termination enclosures.
 - b. Power supply, power distribution, and battery enclosures.
 - c. Equipment enclosures.
 - 2. Fasten tamper switches to prevent access to the switch from the enclosure exterior.
 - 3. Provide individual inputs for each enclosure's tamper switches.

- I. Card Readers:
 - 1. All card readers shall be HID Global Signo series readers

- J. Request-To-Exit (REX):
 - 1. Provide PIR Request to Exit sensors for doors using door strikes:
 - a. Install and configure detector detection pattern to mitigate spoof attacks from objects slid under the door threshold.
 - b. Connect REX sensor output to DGP REX input.
 - 2. Connect REX switch in door lock to DGP REX input.

1.4 DOOR HOLD OPEN DEVICES

- A. The Door hold open devices are specialized door closers provided and installed by Division 8 and controlled by the ACAMS and Fire alarm System.
- B. Stairwell doors may be used for communicating between the floors by the public on an ACAMS schedule.
 - 1. When the schedule is active the associated card reader will activate, energizing the hold open devices in the door closer.
 - 2. When hold open is energized the door can be manually opened and will remain open until the schedule deactivates, or the fire alarm activates.
 - 3. When the schedule is active, and output connected to the associated Door Management Alarm (DMA) will bypass the alarm.
 - 4. When the schedule deactivates, the hold open will deenergize causing the door to close, 30 seconds later, the DMA bypass will deactivate, providing time for the door to close.
 - 5. When the schedule is deactivated staff can use the stairwells without triggering the DMA by using their card in the card reader.
 - a. Note: the card reader only bypasses the DMA, it does not control the door lock, free egress is always available.
 - b. A REX switch in the stairwell side trim will bypass the DMA when on exiting the stairwell door.
- C. The Hold Opens are 24VDC and will be powered from the lock power supply.
 - 1. The fire alarm output relay, connected to the power supply, will deactivate the Hold Open power.

1.5 CYBER SECURITY

- 1. See Section 28 00 00.

1.6 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Coordinate with Division 26 on electrical infrastructure requirements.
 - 2. Coordinate with Division 27 on telecom cabling and infrastructure requirements.
 - 3. Coordinate with AHJ on life-safety requirements.
 - 4. Coordinate with Owner's physical security representative include:
 - a. Alarm notification content.
 - b. Graphic map display content.
 - c. Access control credential requirements.
 - d. User access rights to the ACAMS.
 - e. Subsystem integration requirements.
 - f. System operator, support personnel, and administrator training.
 - g. Existing equipment integration.
 - h. With Owner to minimize disruption to ongoing security operation caused by project work.

1.7 SUBMITTALS

- A. Provide submittals according to Section 28 00 00 General Security Requirements.

1.8 QUALITY ASSURANCE

- A. See Section 28 00 00.

1.9 DELIVERY, STORAGE, AND HANDLING

1.10 SEE SECTION 28 00 00.

1.11 SITE CONDITIONS

- A. See Section 28 00 00.

1.12 WARRANTY

- A. See Section 28 00 00.

PART 2 - PRODUCTS

2.1 OWNER-FURNISHED PRODUCTS

- A. Network Switch:
1. Connect ACAMS components to ports on the TCP/IP OFOI network switch.
 2. Coordinate with Owner's IT staff:
 - a. IT security policy requirements for ACAMS components.
 - b. MAC addresses and port configuration requirements for each ACAMS component.
- B. ACAMS Server and Software:
1. The campus ACAMS is being procured and will be installed prior to construction of this project.
 2. The ACAMS shall be based on the existing campus Lenel S2 system

2.2 PRODUCTS FURNISHED BY OTHERS

- A. Electrified Door Hardware and Locking Devices:
1. Provided by Division 8 contractor.
 - a. Coordinate with Division 8 to ensure correct electrical and wire harness configuration.

2.3 ACCESS CONTROL AND ALARM MONITORING SYSTEM

- A. General:
1. Provide the ACAMS with DGPs and field devices to the existing campus system.
 2. Communicate with DGPs using Ethernet 10/100, TCP/IP network connection.
 3. Provide the ACAMS programming, graphic screens, and data entry for this project's devices.
 4. Must be compatible with Lenel S2
- B. Manufacturer: Mercury field panels compatible with Lenel S2.

- C. UPS:
 - 1. Meet requirements detailed in Section 28 00 00.
 - 2. Provide UPS power for: network switches.

2.4 DATA GATHERING PANELS (DGP):

- A. General:
 - 1. Future DGP capacity: provide spare capacity in the DGPs to accommodate future growth of the system:
 - a. Distribute future capacity equally among DGPs.
 - b. Card readers 10%.
 - c. I/O points 10%.
 - d. Exception – single door controllers mounted at the door require no spare capacity.
 - 2. Provide battery backup specified in Section 28 00 00.
 - 3. Provide power supply monitoring of:
 - a. AC power loss.
 - b. Low battery and battery presence.
 - 4. OSDP compliant.
 - 5. NEMA 1 enclosure with lock and tamper switch:
- B. Manufacturer: Mercury Security.

2.5 LOCK POWER SUPPLIES:

- A. General:
 - 1. Resettable overcurrent circuit protection for each lock circuit.
 - 2. Fire alarm disconnect individually selectable for each lock circuit.
 - 3. Low battery disconnect to prevent deep discharge of battery during AC power failure.
 - 4. Configure the power supplies capacity to match the spare capacity of the field panels.
 - 5. Provide fault monitoring capability of:
 - a. AC power loss.
 - b. Low battery and battery presence.
 - c. Fire alarm disconnect activation.
 - 6. Provide battery backup specified in Section 28 00 00.
 - 7. NEMA 1 enclosure with lock and tamper switch.
- B. Manufacturer:
 - 1. Alarm-Saf.
 - 2. Altronix.
 - 3. LifeSafety Power.

2.6 UPS:

- A. See Section 28 00 00.

2.7 CARD READERS, CARDS AND DOOR HARDWARE

- A. Card Readers:
 - 1. Coordinate with the Owner for compatibility with their campus standard.
 - 2. Manufacturers
 - a. Mullion, HID Signo Reader 20.
 - b. Full size single gang, HID Signo Reader 40.
 - c. Full size single gang with keypad, HID Signo Keypad Reader 20.

- d. OSDP communication required
- 3. Use non-metallic mud rings:
 - a. Use UL rated mud rings in fire rated corridors:
 - 1) Manufacturer: Thomas & Betts/Carlton.

2.8 SURGE PROTECTIVE DEVICES (SPD):

- A. See Section 28 0000.

2.9 REX PIR SENSORS:

- A. Manufacturers:
 - 1. BEA - R2E series.
 - 2. Bosch - DS16x series.
 - 3. Securitron - SMS series.
 - 4. Kantech – TREX series.

2.10 DOOR POSITION SWITCHES:

- A. For glass doors, use bonding sensor in the electromagnetic Lock.
- B. Recessed door/window switches:
 - 1. Provide double pole switch.
 - 2. Manufacturer:
 - a. GRI.
 - b. Magnasphere - MSS-300C Series.
 - c. Honeywell - 947 series.
 - d. Magnasphere - MSS-3xxS series.

2.11 DOOR MANAGEMENT ALARM (DMA):

- A. General:
 - 1. Provide the DMA to annunciate door prop conditions locally and report the alarm to the ACAMS after an adjustable time-delay.
 - 2. Provide input for remote bypass of the unit.
 - 3. Provide a key switch to bypass the unit.
 - 4. Provide ACAMS output to control bypass.
 - 5. Report: bypass, alarm, and fault, to the ACAMS.
- B. Manufacturers:
 - 1. DSI - ES4200 series.

PART 3 - EXECUTION

3.1 GENERAL

- A. Refer to Section 28 00 00 General Security Requirements.
- B. See Section 28 05 13 for Security Cable Installation requirements.
- C. See Section 28 00 00 for Security System Label requirements.
- D. See Section 28 00 00 for Commissioning of Electronic Security System requirements.

- E. Coordinate installation activities with the following Divisions or groups:
 - 1. Division 8 – Door hardware, doors, and frames.
 - 2. Division 26 – Electrical power and pathways.
 - 3. Division 27 – Telecom voice and data cabling.
 - 4. Authority Having Jurisdiction for life-safety requirements.
 - 5. Fire alarm contractor.
 - 6. Owner's IT group.

 - F. Field verify the exact location, position, and mounting for all ACAMS equipment prior to installation.

 - G. Install all system components including Owner furnished equipment, and accessories in accordance with the manufacturer's instructions, and furnish all necessary connectors, terminators, interconnections, services, and adjustments required for a complete and operable system.
- 3.2 INSTALLATION
- A. All equipment shall be tested and configured in accordance with instructions provided by the manufacturer prior to installation.

 - B. IT coordination:
 - 1. Coordinate with Owner IT representative on IP addressing and IT security policies.
 - 2. Set up secure access for both browser based, and mobile platform.

 - C. Software and firmware:
 - 1. All software and firmware found in products shall be the latest and most up-to-date provided by the manufacturer.
 - 2. Coordinate with Owner on passwords for all users.
 - 3. Change all default passwords.

 - D. Access Controllers:
 - 1. Mount access controllers to plywood wall panel:
 - a. Do not mount to unpainted plywood.
 - b. Notify the GC and Engineer of unpainted plywood.
 - 2. Connect controllers to metal raceway using knockouts and rigid couplers or chase nipples to prevent exposed or visible cables entering units.
 - 3. Align and mount power supplies underneath each controller.

 - E. Card Readers and Integrated Card Reader Locks:
 - 1. Provide factory recommended cable.
 - 2. Connect card reader tamper switch (if applicable).
 - 3. Mount card readers to electrical box following painting and finishing of walls.
 - 4. Install card reader cables from DGP in continuous lengths without splices.
 - 5. Connect card reader pigtail-wires using butt splice in-line connectors.
 - 6. Connect Integrated Card Reader Locks using manufacturer recommended modular connectors.
 - 7. Leave shield and drain wire floating at reader end, insulate exposed wire to prevent ground loops.
 - 8. Ground the shield and drain wire at DGP.

 - F. Surge Protective Devices (SPD):
 - 1. Install SPDs to protect:
 - a. The 120 VAC line power: for the DGPs and power supplies.

- b. The security devices located outside of a building connected via metallic signal and/or power lines.
 2. When devices or control panels are connected to exterior metallic conductors, including underground metallic conductors, install SPDs at both ends of the conductor.
 3. Install SPD(s) at the DGP input/output circuit, and power supply (if applicable) for all metallic data, signal, and power lines to the exterior devices.
 4. Match SPD equipment to the protected equipment, including wire sizes, operating voltages, currents and number of conductors.
 5. Install SPDs with hardwired low-voltage circuit lead lengths (conductor/wire distance) a minimum of 3 wire feet, (unless otherwise specified by manufacturer) and that the referenced ground connections are of a lesser distance (conductor/wire length).
 6. All required surge protection must be properly installed, according to manufacturer instructions, prior to applying power or connecting signaling conductors to electronic components.
 - G. Door Hardware:
 1. Report to the GC and Engineer, on discovery, any door-frames that are not properly prepped for the electrified hardware and door contact.
 2. Route power to electrically controlled locks on life-safety doors through fire alarm interface relays for door unlock on fire alarm activation.
 3. Coordinate the installation and termination of the security cable with the installation of the electric door locks and power transfer device.
 4. Use cable harness with manufacture recommended modular connectors when connecting to electrified locks and power transfer devices. Do not remove device modular connectors to splice harness wires.
 5. For door strikes and mortise locks: connect the strike latchbolt monitor switch and the lock status monitor switch in series with door position switch so any switch will activate indicating door not secured.
 - H. Fire Doors:
 1. Labeled fire doors and frames may not be drilled, or in any way modified without approval of the AHJ and the architect.
 - I. Door Contacts:
 1. Install contacts in pre-prepped holes from manufacturer.
 - J. REX PIR Installation:
 1. Install and adjust the PIR sensor to prevent under-door spoof threat.
 - a. Position and aim the PIR sensor so that it will not activate from objects slid under the door.
- ### 3.3 SOFTWARE CONFIGURATION
- A. Implement cyber security requirements: see Section 28 00 00.
 - B. Schedule a system configuration meeting and discuss the following with the Owner and the Engineer:
 1. Review and establish the programming details.
 2. Card reader, input, and output naming convention.
 3. Cardholder data import file, including the file format requirements.
 4. Video surveillance integration.
 5. Alarm notification:
 - a. Message format.
 - b. Camera call-up assignments.
 - c. Notifications priority assignments.

- d. Alarm routing to operator workstation(s).
 6. Graphic maps:
 - a. Graphic detail per screen.
 - b. Alarm icons and controls per screen.
 - c. Menu navigation.
 7. Reports for audit trail, device status, access control and alarm database.
 - a. Canned and configurable reports.
 8. Document the results of the meeting and submit for owner approval prior to the start of system programming/configuration.
- C. Create and maintain hard copy worksheets to document the programming and configuration:
1. Submit worksheets for owner approval prior to start of programming.
 2. Keep worksheets up to date on a daily basis.
 3. Submit worksheets with the closeout submittal.
- D. Develop system graphics and maps:
1. Request the current floor plan CAD files to develop graphic maps.
 2. Include icons for doors, alarm points, tamper circuits.
 3. Icons to indicate alarm, trouble and normal states.
 4. Operator control icons for outputs, camera call-up and software controls.
- E. Structure the programming to allow the field devices and control panels to operate independently of the host computer wherever possible.
- F. Structure the programming to minimize the user effort to maintain and administer the system.
- G. Load cardholder database provided in an electronic file from the Owner.
- H. Program and setup the system to require no additional programming by the Owner.
- I. Customize menus with the assistance of the factory to "gray-out" features not used on project.
- J. System software backup:
1. Maintain a complete, up-to-date backup of the system configuration and database.
 2. Maintain copies on a rotating basis, until final acceptance by Owner.

3.4 SYSTEM INTEGRATION

- A. Video Surveillance System Integration:
1. Automatic video call-up:
 - a. Configure alarm notification to call-up cameras associated with the alarm to the screen of the ACAMS alarm operator workstation.
 - b. Provide associated pre and post alarm camera video clips of 10 seconds of video before the alarm and 30 seconds after the alarm.
 - c. These automated features will not require a manual video search.
 2. Record all cameras associated with the alarm for forensic analysis, including pre and post alarm video.
 3. Camera call-up and control from ACAMS graphic screens.

3.5 CLOSEOUT ACTIVITIES

- A. Testing and commissioning: see Section 28 00 00 for testing and commissioning requirements.

- B. Training: see Section 28 00 00 for operation, administration and maintenance training requirements.
- C. Submit As-Built drawings.
- D. Submit final programming and setup parameters, in electronic format.
- E. Provide backup copy of all system software and configuration data.
- F. Provide instructions on system back-up and recovery procedures.

End of Section

SECTION 28 14 00 - ELEVATOR LANDING COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

- A. General: Furnish engineering, labor, materials, apparatus, tools, equipment, transportation, temporary construction and special or occasional services as required to make a complete working intercom and entry control installation, as described in these specifications.
- B. Section includes:
 - 1. Elevator landing 2-way communications system:
 - a. Calling Stations.
 - b. Base Station.
- C. Products installed but not furnished under this section:
 - 1. Coordination to remain a requirement of this section.
 - 2. Structured cable and outlets (by division 27).
 - 3. Network switch(s).
- D. Related requirements
 - 1. Section 07 84 00 Firestopping.
 - 2. Section 26 00 00 Electrical.
 - 3. Section 27 00 00 Communications.
 - 4. Section 28 00 00 General Security System Requirements.
 - 5. Section 28 05 13 Security System Cabling.
 - 6. Section 28 13 00 Access Control and Alarm Monitoring System.

1.2 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. See Section 28 00 00
- B. Definitions:
 - 1. See Section 28 00 00

1.3 SYSTEM DESCRIPTION

- A. Elevator Landing 2-way Communications System Overview:
 - 1. The Elevator Landing Communication System consist of Calling Stations (substations), Master Station, and the connection to the campus emergency communication system.
 - 2. Comply with California State Fire Marshal requirements.
 - 3. This system is an Emergency Communications System as defined in NFPA 72 Chapter 24.
 - 4. Provide callings stations, and control equipment as shown on drawings.
 - 5. Provide Master Station:
 - a. The location in the Fire Control Room has not been coordinated with the Authority Having Jurisdiction, this coordination is a requirement of the contractor.
 - 6. Provide the following functions:

- a. The emergency communication system must be usable for people with hearing impairments, speech impairments, and difficulty reaching.
- b. A system with both visible and audible signals allows people with hearing or speech difficulties to receive information.
- c. A light indicating the call was received and a voice intercom make the system more accessible in an emergency.
- d. Push to talk Call Stations, a handset is not acceptable.
- e. Unanswered calls roll over to the 24x7 staffed campus Emergency Communication System.
- f. The roll over call must establish a 2-way communication with the between the calling station and the receiving party, a recorded message only is not acceptable.
- g. Duplex audio communication between Call Stations and Base Station.
7. Battery backup is required per NFPA 72.
8. The system and installation must comply with all the relevant requirements of the California Building Code (CBC) including Section 1009.8.
9. Area of Refuge signage will be provided by others

1.4 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 1. Coordinate with Division 26 on electrical infrastructure requirements.
 2. Coordinate with Division 27 on telecom cabling and infrastructure requirements.
 3. Coordinate with Owner's physical security representative include:
 - a. User access rights.

1.5 SUBMITTALS

- A. Provide submittals according to Section 28 00 00 General Security Requirements.

1.6 QUALITY ASSURANCE

- A. See Section 28 00 00.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. See Section 28 00 00.

1.8 SITE CONDITIONS

- A. See Section 28 00 00.

1.9 WARRANTY

- A. See Section 28 00 00.

PART 2 - PRODUCTS

2.1 OWNER-FURNISHED PRODUCTS

- A. Network switches.

2.2 PRODUCTS NOT FURNISHED UNDER THIS SECTION:

- A. Coordination to remain a requirement of this section.
- B. Network switch.
- C. CBC required signage.

2.3 ELEVATOR LANDING 2-WAY COMMUNICATION SYSTEM

- A. General:
 - 1. Install the system per CBC 1009.8 and NFPA 72 chapters 12, 23, and 24 requirements, including the use of 2-hour rated Circuit Integrity (CI) cable.
 - 2. A network switch dedicated to the Elevator Landing Communication System will be provided by the campus and installed in the BDF.
 - 3. Provide a UPS for the PoE switch:
 - a. Comply with NFPA 72 power requirements.
 - b. See Section 28 00 00 for the 24-hour UPS requirements.
- B. Elevator landing calling stations:
 - 1. Provide stations as indicated on the floor plans and connect to the Campus Emergency Communication System (ECS), using the Zenitel AlphaCom Server.
 - 2. Modify the station LED lights to comply with the Visible Communication Method called out in CBC 1009.8.1.1 "A button complying with Section 1138A.4 or Sections 11B-205 and 11B-309 in the area of refuge shall activate both a light in the area of refuge indicating that rescue has been requested and a light at the central control point indicating that rescue is being requested. A button at the central control point shall activate both a light at the central control point and a light in the area of refuge indicating that the request has been received."
 - a. LED control may be by programming or auxiliary relays.
 - 3. Manufacturer: Zenitel TMIS-2
- C. Master station:
 - 1. Provide a Master Station per the drawings:
 - a. Connect to the campus ECS.
 - b. Modify the station LED lights to comply with the Visible Communication Method above.
 - c. Coordinate with the AHJ on location.
 - 2. Manufacturer: Zenitel CRM-V

PART 3 - EXECUTION

3.1 GENERAL

- A. Refer to Section 28 00 00 General Security Requirements.
- B. See Section 28 05 13 for Security Cable Installation requirements.
- C. See Section 28 00 00 for Security System Label requirements.
- D. See Section 28 00 00 for Commissioning of Electronic Security System requirements.
- E. Coordinate installation activities with the following Divisions or groups:
 - 1. Division 26 – Electrical power and pathways.
 - 2. Division 27 – Telecom voice and data cabling.
 - 3. Campus IT group.

- F. Field verify the exact location, position, and mounting for all equipment prior to installation.
- G. Install all system components including Owner furnished equipment, and appurtenances in accordance with the manufacturer's instructions, and furnish all necessary connectors, terminators, interconnections, services, and adjustments required for a complete and operable system.

3.2 INSTALLATION

- A. All equipment shall be tested and configured in accordance with instructions provided by the manufacturer prior to installation.
- B. Provide manufacturer recommended communication and power cables.
- C. IT coordination:
 - 1. Coordinate with Owner IT representative on IP addressing and IT security policies.
 - 2. Set up secure access for both browse- based, and mobile phone or tablet-based user interfaces.
- D. Software and firmware:
 - 1. All software and firmware found in products shall be the latest and most up to date provided by the manufacturer.
 - 2. Coordinate with Owner on passwords for all users.
 - 3. Change all default passwords.

3.3 CLOSEOUT ACTIVITIES

- A. Testing and commissioning: see Section 28 00 00 for testing and commissioning requirements.
- B. Training: see Section 28 00 00 for operation, administration and maintenance training requirements.
- C. Submit As-Built drawings.
- D. Submit final programing and setup parameters, in electronic format.
- E. Provide backup copy of all system software and configuration data.

END OF SECTION 28 1400

SECTION 282300 - VIDEO SURVEILLANCE SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

- A. General: Provide engineering, labor, materials, apparatus, tools, equipment, transportation, temporary construction, and special or occasional services as required to make a complete working video surveillance system installation, as described in the contract documents.
- B. Section Includes:
 - 1. Video Surveillance System.
 - 2. Network Video Recorder(s).
 - 3. Surveillance cameras.
 - 4. Workstations.
 - 5. Network communication.
- C. Related Sections:
 - 1. Section 07 84 00 Firestopping.
 - 2. Section 26 00 00 Electrical.
 - 3. Section 27 00 00 Communications.
 - 4. Section 28 00 00 General Security Requirements.
 - 5. Section 28 05 13 Security System Cabling.
 - 6. Section 28 13 00 Access Control and Alarm Monitoring System.
 - 7. Section 28 14 00 Intercom and Elevator Landing Communication.

1.2 REFERENCES

- A. See Section 28 00 00.

1.3 SYSTEM DESCRIPTION

- A. Provide an IP Video Surveillance System (VSS) that is an extension of the existing campus VSS. Provide all equipment and work required for extension of the VSS to the existing system head end with integration ACAMS.
 - 1. Provide UPSs for Owner supplied network communications equipment (see Section 28 00 00).
- B. Coordinate all work with applicable trades.

1.4 CYBER SECURITY

- 1. See Section 28 00 00.

1.5 ADMINISTRATIVE REQUIREMENTS

- A. See Section 28 00 00.

1.6 SUBMITTALS

- A. See Section 28 00 00.

1.7 QUALITY ASSURANCE

- A. See Section 28 00 00.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. See Section 28 00 00.

1.9 FIELD CONDITIONS

- A. See Section 28 00 00.

1.10 WARRANTY

- A. See Section 28 00 00.

PART 2 - PRODUCTS

2.1 OWNER-FURNISHED PRODUCTS

- A. Network Switch:
 - 1. Connect ACAMS components to ports on the TCP/IP OFOI network switch.
 - 2. Coordinate with Owner's IT staff:
 - a. IT security policy requirements for VSS components.
 - b. MAC addresses and port configuration requirements for each VSS component.
- B. VMS Server and Software:
 - 1. The campus VMS is being procured and will be installed prior to construction of this project.
 - 2. System shall be Lenel (S2), no substitutes
- C. UPS:
 - 1. Coordinate with Owner on backup power requirements detailed in Section 28 00 00 for Network switches supporting the ACAMS and VSS.

2.2 PRODUCTS PROVIDED BY OTHERS

- A. Camera UTP cabling (By division 27).
- B. Camera structured cabling to the equipment rack patch panel.

2.3 CAMERAS

- A. Camera requirements.
 - 1. See drawings for minimum camera resolution.
 - 2. Compatible with the VMS.
 - 3. ONVIF Profile S or ONVIF Version 1.01 or higher.
 - 4. Support Quality of Service (QoS) to be able to prioritize traffic.
 - 5. Support MJPEG, MPEG and H.264 encoding.
 - 6. Support Unicast and multicast transport.
 - 7. Multi-stream - at least two individually configurable full resolution full frame rate IP video streams.

8. Provide the ability to backup and restore camera settings through an embedded Web browser.
 9. Provide simple motion detection to detect motion within a user-defined field of view or within a user specified rectangular zone.
 10. Use IR-sensitive progressive scan sensor.
 11. Day-night Color/B&W camera with mechanical IR cut filter.
 12. Auto-iris.
 13. Provide both landscape format (4:3 and 16:9 aspect ratio) as well as portrait format (3:4 and 9:16 aspect ratio).
 14. Vandal resistant.
 15. Exterior cameras:
 - a. Rated for IP66 exterior application.
 - b. Support operation between -40 to +130°F.
 - c. Dome cameras to have clear domes for improved low-light sensitivity.
 16. Provide Wide Dynamic Range Feature.
- B. Fixed Dome Cameras:
1. IEEE 802.3af (Power over Ethernet).
 2. Smoked colored lower dome for interior cameras.
 3. See drawings for camera resolution, minimum resolution of 1080p.
 4. Motorized vari-focal lens sized to provide the owner approved field of view.
 5. Day/Night feature with IR filter.
 6. Vandal resistance: IK10.
 7. Manufacturer: Axis P32 series.
- C. Dual-imager Camera:
1. Provide dual mini-dome camera with fixed lenses that meet the Owner's viewing requirements.
 2. Minimum total resolution 4MP.
 3. Vandal resistance: IK10.
 4. Manufacturer: Axis P3715-PLVE.
 5. .
- D. 270 Degree Multi-imager Cameras:
1. Provide 270° or 360° field-of-view with multiple imagers.
 2. Minimum total resolution 15MP.
 3. Remote setup of individual imagers.
 4. IR illuminators
 5. Vandal resistance: IK09.
 6. Manufacturers:
 - a. Axis P3719-PLE.
- E. 180 Degree Multi-imager Cameras:
1. Provide 180° field-of-view with multiple imagers.
 2. Minimum total resolution 15MP.
 3. Factory focused lenses.
 4. Vandal resistance: IK10.
 5. Manufacturers:
 - a. Axis Q3708-PVE.
- F. Panoramic Camera:
1. Provide 360-degree field-of-view camera with dewarping software.
 2. Single imager.
 3. Minimum resolution 12MP.
 4. Manufacturer: Axis M3058-PLVE

2.4 SURGE PROTECTIVE DEVICES (SPD):

- A. See Section 28 0000.

PART 3 - EXECUTION

3.1 GENERAL

- A. See Section 28 00 00 General Security Requirements.
- B. See Section 28 05 13 for Security Cable Installation requirements.
- C. See Section 28 00 00 for Security System Label requirements.
- D. See Section 28 00 00 for Commissioning of Electronic Security System requirements.
- E. Coordinate installation activities with the following Divisions or groups:
 - 1. Division 26 – Electrical power and pathways.
 - 2. Division 27 – Telecom voice and data cabling.
 - 3. Owner's IT group.
- F. Field verify the exact location, position, and mounting for all VSS equipment prior to installation.
- G. Install all system components including Owner furnished equipment, and appurtenances in accordance with the manufacturer's instructions, and furnish all necessary connectors, terminators, interconnections, services, and adjustments required for a complete and operable system.
- H. Equipment power: see Section 28 00 00.

3.2 INSTALLATION

- A. All equipment shall be tested and configured in accordance with instructions provided by the manufacturer prior to installation.
- B. Equipment Rack:
 - 1. Rack mount UPS units located in the equipment racks/cabinets.
- C. IT coordination:
 - 1. Coordinate with Owner IT representative on IP addressing and IT security policies.
 - 2. Set up secure access for VSS viewers, both browser-based, and mobile phone or tablet based.
- D. Software and firmware.
 - 1. All software and firmware found in products shall be the latest and most up to date provided by the manufacturer.
 - a. Provide cameras with the current version of firmware, unless the provider of the VMS or NVR requires a different version.
 - 2. See Section 28 00 00 on cyber security requirements.
- E. Surge Protective Devices (SPD):
 - 1. Install SPDs to protect:

- a. The 120 VAC line power to the VSS equipment.
 - b. The VSS devices located outside of a building connected via metallic signal and/or power lines.
 2. When VSS devices are connected to exterior metallic conductors, including underground metallic conductors, install SPDs at both ends of the conductor.
 3. Match SPD equipment to the protected equipment, including wire sizes, operating voltages, currents and number of conductors.
 4. Install SPDs with hardwired low-voltage circuit lead lengths (conductor/wire distance) a minimum of 3 wire feet, (unless otherwise specified by manufacturer) and that the referenced ground connections are of a lesser distance (conductor/wire length).
 5. All required surge protection must be installed, according to manufacturer instructions, prior to applying power or connecting signaling conductors to electronic components.
 - F. Interconnection of rack mounted video equipment:
 1. Connect signal paths between video equipment as required:
 - a. Cables shall be as short as practicable for each signal path without causing strain at the connectors.
 - b. Rack mounted equipment on slide mounts shall have cables of sufficient length to allow full extension of the slide rails from the rack.
 - c. Use cable managers to reduce cable strain and provide a neat cable appearance.
 - d. Observe cable manufacturer's bend radius requirements.
 - G. Cameras:
 1. Coordinate with Owner security representative on field of view for each camera.
 2. Focus the lens to give a sharp picture (to include checking for day and night focus and image quality) over the entire field of view.
 3. Set PTZ cameras preset positions and privacy areas.
 4. Provide an electrical ground for all exterior cameras per the SPD manufacturer's requirements.
 - H. Camera Housings, Mounts, and Poles:
 1. Install the camera housings and mounts as specified by the manufacturer and as shown.
 2. Provide mounting hardware sized appropriately to secure each camera, housing and mount with maximum wind and ice loading encountered at the site.
 3. Provide a foundation for each camera pole as specified and shown.
 4. Provide a ground rod for each camera pole.
 - a. Connect the camera pole to the ground rod as specified in Division 26 and the applicable building codes.
 - I. Network Video Recorder (NVR):
 1. See Section 28 00 00 for emergency power requirements.
 - J. Integrate with ACAMS as called for in Section 281300.
- 3.3 NETWORK CONFIGURATION
1. SNMP - Configure the SNMP monitoring application to monitor traps and notify for faults including:
 - a. Camera faults
 - b. ACAMS server faults
 - c. NVR faults
 - d. Disk drive faults
 - e. Network switch ports faults
 - f. ACAMS power supply faults (if supported)

2. Network Time
 - a. Synchronize all network devices to the time server.

3.4 SOFTWARE CONFIGURATION

- A. Implement cyber security requirements: see Section 28 00 00.
- B. Schedule a system configuration meeting and discuss the following with the Owner and the Engineer:
 1. Review and establish the programming details.
 2. camera naming convention.
 3. ACAMS integration.
 4. Camera recording requirements.
 - a. Schedules for camera recording.
 - b. Frame rate and resolution settings.
 - c. Online video storage requirements.
 - d. Offline storage.
 5. Network security requirements.
 6. VSS workstation.
 - a. Workstation and video monitor(s) setup.
 - b. Graphic User Interface programming.
 7. Browser based and mobile phone/tablet-based viewers.
 8. Field of view requirements for each camera.
 9. Motion detection zones for each camera.
 10. Document the results of the meeting and submit for owner approval prior to the start of system programming/configuration.
- C. Create and maintain worksheets to document the programming and configuration:
 1. Submit worksheets for owner approval prior to start of programming.
 2. Keep worksheets up to date daily.
 3. Submit worksheets with the closeout submittal.
- D. Structure the programming to minimize the user effort to maintain and administer the system.
- E. Maintain a complete, up-to-date backup of the system configuration and database:
 1. Maintain copies on a rotating basis, until final acceptance by Owner.
- F. System software backup:
 1. Maintain a complete, up-to-date backup of the system configuration and database.
 2. Maintain copies on a rotating basis, until final acceptance by Owner.

3.5 SYSTEM INTEGRATION

- A. ACAMS Integration: See Section 28 13 00.

3.6 CLOSEOUT ACTIVITIES

- A. Testing and commissioning: see Section 28 00 00 for testing and commissioning requirements.
- B. Training: see Section 28 00 00 for operation, administration and maintenance training requirements.
- C. Submit As-Built drawings.

- D. Submit final programing and setup parameters, in electronic format.
- E. Provide backup copy of all system software and configuration data.
- F. Provide instructions on system back-up and recovery procedures.

End of Section

SECTION 283111 - DIGITAL, ADDRESSABLE FIRE-ALARM SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

- A. This work includes designing and providing a new, completely supervised, multiplexed, addressable, intelligent, analog fire alarm system (devices, components and wiring) as described herein and on the contract drawings for the Project.
1. NO SUBSTITUTIONS: Provide a new fire alarm system exclusively consisting of a Gamewell fire alarm panel and all associated products for a complete fire alarm system, except where otherwise indicated.
 2. Include all wiring, raceways, pull boxes, terminal cabinets, outlet and mounting boxes, control equipment, alarm, and supervisory signal initiating devices, alarm notification appliances, software and programming, acceptance testing and all other accessories and miscellaneous items required for a complete operating system even though each item is not specifically mentioned or described. Provide equipment with components identical to and bearing the labeling of those approved for intended use by independent testing laboratory.
- B. Section Includes:
1. Fire-alarm control unit.
 2. Manual fire-alarm boxes.
 3. System smoke detectors.
 4. Air-sampling smoke detectors.
 5. Nonsystem smoke detectors.
 6. Heat detectors.
 7. Notification appliances.
 8. Device guards.
 9. Remote annunciator.
 10. Addressable interface device.
 11. Digital alarm communicator transmitter.
 12. Notification appliance circuit power extender panel (NAC).
 13. Network communications.
- C. Related Requirements:
1. Section 013573 "Delegated Design Requirements and Procedures" for definitions, submittal procedures, responsibilities, and scheduling requirements associated with delegated design assignment indicated in this Section.
 2. Division 07 Section "Penetration Firestopping" • • for fire stopping requirements not in this Section.
 3. Provisions of Division 26 Sections "Common Work Results for Electrical" • • and Raceways and Boxes for Electrical Systems" • • apply to this Section.
 4. Section 280513 "Conductors and Cables for Electronic Safety and Security" for cables and conductors for fire-alarm systems.

1.2 DEFINITIONS

- A. EMT: Electrical Metallic Tubing.
- B. FACP: Fire Alarm Control Panel.
- C. HLI: High Level Interface.
- D. NICET: National Institute for Certification in Engineering Technologies.
- E. PC: Personal computer.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product, including furnished options and accessories.
 - 1. Include construction details, material descriptions, dimensions, profiles, and finishes.
 - 2. Include rated capacities, operating characteristics, and electrical characteristics.

- B. Shop Drawings: For fire-alarm system.
 - 1. Comply with recommendations and requirements in the "Documentation" section of the "Fundamentals" chapter in NFPA 72.
 - 2. Include plans, elevations, sections, details, and attachments to other work.
 - 3. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and locations. Indicate conductor sizes, indicate termination locations and requirements, and distinguish between factory and field wiring.
 - 4. Detail assembly and support requirements.
 - 5. Include voltage drop calculations for notification-appliance circuits.
 - 6. Include battery-size calculations.
 - 7. Include input/output matrix.
 - 8. Include statement from manufacturer that all equipment and components have been tested as a system and meet all requirements in this Specification and in NFPA 72.
 - 9. Include performance parameters and installation details for each detector.
 - 10. Verify that each duct detector is listed for complete range of air velocity, temperature, and humidity possible when air-handling system is operating.
 - 11. Include plans, sections, and elevations of heating, ventilating, and air-conditioning ducts, drawn to scale; coordinate location of duct smoke detectors and access to them.
 - a. Show field wiring required for HVAC unit shutdown on alarm.
 - b. Locate detectors according to manufacturer's written recommendations.
 - 12. Include voice/alarm signaling-service equipment rack or console layout, grounding schematic, amplifier power calculation, and single-line connection diagram.
 - 13. Include floor plans to indicate final outlet locations showing address of each addressable device. Show size and route of cable and conduits and point-to-point wiring diagrams.

- C. General Submittal Requirements:
 - 1. Submittals shall be approved by authorities having jurisdiction prior to submitting them to Architect.
 - 2. Shop Drawings shall be prepared by persons with the following qualifications:
 - a. Trained and certified by manufacturer in fire-alarm system design.
 - b. NICET-certified, fire-alarm technician; Level III minimum.
 - c. Licensed or certified by authorities having jurisdiction.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For Installer.

- B. Seismic Qualification Certificates: For fire-alarm control unit, accessories, and components, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

- C. Field quality-control reports.

- D. Sample Warranty: For special warranty.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For fire-alarm systems and components to include in emergency, operation, and maintenance manuals.
1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following and deliver copies to authorities having jurisdiction:
 - a. Comply with the "Records" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
 - b. Provide "Fire Alarm and Emergency Communications System Record of Completion Documents" according to the "Completion Documents" Article in the "Documentation" section of the "Fundamentals" chapter in NFPA 72.
 - c. Complete wiring diagrams showing connections between all devices and equipment. Each conductor shall be numbered at every junction point with indication of origination and termination points.
 - d. Riser diagram.
 - e. Device addresses.
 - f. Record copy of site-specific software.
 - g. Provide "Inspection and Testing Form" according to the "Inspection, Testing and Maintenance" chapter in NFPA 72, and include the following:
 - 1) Equipment tested.
 - 2) Frequency of testing of installed components.
 - 3) Frequency of inspection of installed components.
 - 4) Requirements and recommendations related to results of maintenance.
 - 5) Manufacturer's user training manuals.
 - h. Manufacturer's required maintenance related to system warranty requirements.
 - i. Abbreviated operating instructions for mounting at fire-alarm control unit and each annunciator unit.
- B. Software and Firmware Operational Documentation:
1. Software operating and upgrade manuals.
 2. Program Software Backup: On magnetic media or compact disk, complete with data files.
 3. Device address list.
 4. Printout of software application and graphic screens.

1.6 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Lamps for Remote Indicating Lamp Units: Quantity equal to 10 percent of amount installed, but no fewer than one unit.
 2. Lamps for Strobe Units: Quantity equal to 10 percent of amount installed, but no fewer than one unit.
 3. Smoke Detectors, Fire Detectors: Quantity equal to 10 percent of amount of each type installed, but no fewer than one unit of each type.
 4. Detector Bases: Quantity equal to two percent of amount of each type installed, but no fewer than one unit of each type.
 5. Keys and Tools: One extra set for access to locked or tamperproofed components.
 6. Audible and Visual Notification Appliances: One of each type installed.
 7. Fuses: Two of each type installed in the system. Provide in a box or cabinet with compartments marked with fuse types and sizes.

1.7 QUALITY ASSURANCE

- A. Installer Qualifications: Personnel shall be trained and certified by manufacturer for installation of units required for this Project.

- B. Installer Qualifications: Installation shall be by personnel certified by NICET as minimum fire-alarm Level III technician.
- C. NFPA Certification: Obtain certification according to NFPA 72 by an NRTL (nationally recognized testing laboratory).

1.8 PROJECT CONDITIONS

- A. Perform a full test of the existing system prior to starting work. Document any equipment or components not functioning as designed.
- B. Use of Devices during Construction: Protect devices during construction unless devices are placed in service to protect the facility during construction.

1.9 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace fire-alarm system equipment and components that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Extent: All equipment and components not covered in the Maintenance Service Agreement.
 - 2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

- A. Noncoded, UL-certified FM Global-placarded addressable system, with multiplexed signal transmission and voice/strobe evacuation.
- B. Automatic sensitivity control of certain smoke detectors.
- C. All components provided shall be listed for use with the selected system.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 SYSTEMS OPERATIONAL DESCRIPTION

- A. Fire-alarm signal initiation shall be by one or more of the following devices and systems:
 - 1. Manual stations.
 - 2. Heat detectors.
 - 3. Smoke detectors.
 - 4. Duct smoke detectors.
 - 5. Automatic sprinkler system water flow.
- B. Fire-alarm signal shall initiate the following actions:
 - 1. Continuously operate alarm notification appliances, including voice evacuation notices.
 - 2. Identify alarm and specific initiating device at fire-alarm control unit, connected network control panels, off-premises network control panels, and remote annunciators.
 - 3. Transmit an alarm signal to the remote alarm receiving station.
 - 4. Activate voice/alarm communication system.
 - 5. Switch heating, ventilating, and air-conditioning equipment controls to fire-alarm mode.
 - 6. Close smoke dampers in air ducts of designated air-conditioning duct systems.
 - 7. Recall elevators to primary or alternate recall floors.

8. Activate emergency lighting control.
9. Record events in the system memory.

C. Supervisory signal initiation shall be by one or more of the following devices and actions:

1. Valve supervisory switch.
2. Duct smoke detector.
3. User disabling of zones or individual devices.
4. Loss of communication with any panel on the network.

D. System trouble signal initiation shall be by one or more of the following devices and actions:

1. Open circuits, shorts, and grounds in designated circuits.
2. Opening, tampering with, or removing alarm-initiating and supervisory signal-initiating devices.
3. Loss of communication with any addressable sensor, input module, relay, control module, remote annunciator, printer interface, or Ethernet module.
4. Loss of primary power at fire-alarm control unit.
5. Ground or a single break in internal circuits of fire-alarm control unit.
6. Abnormal ac voltage at fire-alarm control unit.
7. Break in standby battery circuitry.
8. Failure of battery charging.
9. Abnormal position of any switch at fire-alarm control unit or annunciator.
10. Voice signal amplifier failure.
11. Loss of communication between remote call stations and master control station for two-way communication system for rescue assistance.
12. Open circuits, shorts, and grounds in circuits in two-way communication system.
13. Open circuits, shorts, and grounds in telephone circuits in two-way communication system.
14. Power supply trouble in two-way communication system.

E. System Supervisory Signal Actions:

1. Initiate notification appliances.
2. Identify specific device initiating the event at fire-alarm control unit, connected network control panels, off-premises network control panels, and remote annunciators.
3. After a time delay of 200 seconds, transmit a trouble or supervisory signal to the remote alarm receiving station.

2.3 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Fire-alarm control unit and raceways shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2.4 FIRE-ALARM CONTROL UNIT

A. Manufacturers: Subject to compliance with requirements, provide products by the following:

1. Gamewell.

B. General Requirements for Fire-Alarm Control Unit:

1. Field-programmable, microprocessor-based, modular, power-limited design with electronic modules, complying with UL 864.
 - a. System software and programs shall be held in nonvolatile flash, electrically erasable, programmable, read-only memory, retaining the information through failure of primary and secondary power supplies.
 - b. Include a real-time clock for time annotation of events on the event recorder and printer.

- c. Provide communication between the FACP and remote circuit interface panels, annunciators, and displays.
 - d. The FACP shall be listed for connection to a central-station signaling system service.
 - e. Provide nonvolatile memory for system database, logic, and operating system and event history. The system shall require no manual input to initialize in the event of a complete power down condition. The FACP shall provide a minimum 500-event history log.
 2. Addressable Initiation Device Circuits: The FACP shall indicate which communication zones have been silenced and shall provide selective silencing of alarm notification appliance by building communication zone.
 3. Addressable Control Circuits for Operation of Notification Appliances and Mechanical Equipment: The FACP shall be listed for releasing service.
- C. Alphanumeric Display and System Controls: Arranged for interface between human operator at fire-alarm control unit and addressable system components including annunciation and supervision. Display alarm, supervisory, and component status messages and the programming and control menu.
 1. Annunciator and Display: Liquid-crystal type, 80 characters, minimum.
 2. Keypad: Arranged to permit entry and execution of programming, display, and control commands.
- D. Alphanumeric Display and System Controls: Arranged for interface between human operator at fire-alarm control unit and addressable system components including annunciation and supervision. Display alarm, supervisory, and component status messages and the programming and control menu.
 1. Annunciator and Display: Liquid-crystal type, two line(s) of 80 characters, minimum.
 2. Keypad: Arranged to permit entry and execution of programming, display, and control commands.
- E. Initiating-Device, Notification-Appliance, and Signaling-Line Circuits:
 1. Pathway Class Designations: NFPA 72, Class B.
 2. Pathway Survivability: Level 1.
 3. Install no more than 256 addressable devices on each signaling-line circuit.
 4. Serial Interfaces:
 - a. One dedicated RS 485 port for central-station operation using point ID DACT.
 - b. One RS 485 port for remote annunciators, Ethernet module, or multi-interface module (printer port).
 - c. One USB port for PC configuration.
 - d. One RS 232 port for voice evacuation interface.
- F. Smoke-Alarm Verification:
 1. Initiate audible and visible indication of an "alarm-verification" signal at fire-alarm control unit.
 2. Activate an approved "alarm-verification" sequence at fire-alarm control unit and detector.
 3. Sound general alarm if the alarm is verified.
 4. Cancel fire-alarm control unit indication and system reset if the alarm is not verified.
- G. Notification-Appliance Circuit:
 1. Audible appliances shall sound in a three-pulse temporal pattern, as defined in NFPA 72.
 2. Visual alarm appliances shall flash in synchronization where multiple appliances are in the same field of view, as defined in NFPA 72.
- H. Elevator Recall:
 1. Elevator recall shall be initiated only by one of the following alarm-initiating devices:
 - a. Elevator lobby detectors except the lobby detector on the designated floor.
 2. Elevator controller shall be programmed to move the cars to the alternate recall floor if lobby detectors located on the designated recall floors are activated.

- I. Remote Smoke-Detector Sensitivity Adjustment: Controls shall select specific addressable smoke detectors for adjustment, display their current status and sensitivity settings, and change those settings. Allow controls to be used to program repetitive, time-scheduled, and automated changes in sensitivity of specific detector groups. Record sensitivity adjustments and sensitivity-adjustment schedule changes in system memory, and print out the final adjusted values on system printer.
- J. Transmission to Remote Alarm Receiving Station: Automatically transmit alarm, supervisory, and trouble signals to a remote alarm station.
- K. Voice/Alarm Signaling Service: Central emergency communication system with redundant microphones, preamplifiers, amplifiers, and tone generators provided as a special module that is part of fire-alarm control unit.
 - 1. Indicate number of alarm channels for automatic, simultaneous transmission of different announcements to different zones or for manual transmission of announcements by use of the central-control microphone. Amplifiers shall comply with UL 1711.
 - a. Allow the application of, and evacuation signal to, indicated number of zones and, at the same time, allow voice paging to the other zones selectively or in any combination.
 - b. Programmable tone and message sequence selection.
 - c. Standard digitally recorded messages for "Evacuation" and "All Clear."
 - d. Generate tones to be sequenced with audio messages of type recommended by NFPA 72 and that are compatible with tone patterns of notification-appliance circuits of fire-alarm control unit.
 - 2. Status Annunciator: Indicate the status of various voice/alarm speaker zones and the status of firefighters' two-way telephone communication zones.
 - 3. Preamplifiers, amplifiers, and tone generators shall automatically transfer to backup units, on primary equipment failure.
- L. Primary Power: 24-V dc obtained from 120-V ac service and a power-supply module. Initiating devices, notification appliances, signaling lines, trouble signals, supervisory and digital alarm communicator transmitters shall be powered by 24-V dc source.
 - 1. Alarm current draw of entire fire-alarm system shall not exceed 80 percent of the power-supply module rating.
- M. Secondary Power: 24-V dc supply system with batteries, automatic battery charger, and automatic transfer switch.
 - 1. Batteries: Sealed lead calcium.
- N. Instructions: Computer printout or typewritten instruction card mounted behind a plastic or glass cover in a stainless-steel or aluminum frame. Include interpretation and describe appropriate response for displays and signals. Briefly describe the functional operation of the system under normal, alarm, and trouble conditions.

2.5 MANUAL FIRE-ALARM BOXES

- A. Manufacturers: Subject to compliance with requirements, provide products by the following:
 - 1. GAMEWELL.
- B. General Requirements for Manual Fire-Alarm Boxes: Comply with UL 38. Boxes shall be finished in red with molded, raised-letter operating instructions in contrasting color; shall show visible indication of operation; and shall be mounted on recessed outlet box. If indicated as surface mounted, provide manufacturer's surface back box.
 - 1. Double-action mechanism requiring two actions to initiate an alarm, pull-lever type; with integral addressable module arranged to communicate manual-station status (normal, alarm, or trouble) to fire-alarm control unit.

2. Station Reset: Key- or wrench-operated switch.
3. Indoor Protective Shield: Factory-fabricated, clear plastic enclosure hinged at the top to permit lifting for access to initiate an alarm. Lifting the cover actuates an integral battery-powered audible horn intended to discourage false-alarm operation.
4. Weatherproof Protective Shield: Factory-fabricated, clear plastic enclosure hinged at the top to permit lifting for access to initiate an alarm.

2.6 SYSTEM SMOKE DETECTORS

- A. Manufacturers: Subject to compliance with requirements, provide products by the following:
1. GAMEWELL.
- B. General Requirements for System Smoke Detectors:
1. Comply with UL 268; operating at 24-V dc, nominal.
 2. Detectors shall be four -wire type.
 3. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control unit.
 4. Base Mounting: Detector and associated electronic components shall be mounted in a twist-lock module that connects to a fixed base. Provide terminals in the fixed base for connection to building wiring.
 5. Self-Restoring: Detectors do not require resetting or readjustment after actuation to restore them to normal operation.
 6. Integral Visual-Indicating Light: LED type, indicating detector has operated[and power-on status].
 7. Remote Control: Unless otherwise indicated, detectors shall be digital-addressable type, individually monitored at fire-alarm control unit for calibration, sensitivity, and alarm condition and individually adjustable for sensitivity by fire-alarm control unit.
 - a. Rate-of-rise temperature characteristic of combination smoke- and heat-detection units shall be selectable at fire-alarm control unit for 15 or 20 deg F per minute.
 - b. Fixed-temperature sensing characteristic of combination smoke- and heat-detection units shall be independent of rate-of-rise sensing and shall be settable at fire-alarm control unit to operate at 135 or 155 deg F.
 - c. Multiple levels of detection sensitivity for each sensor.
 - d. Sensitivity levels based on time of day.
- C. Photoelectric Smoke Detectors:
1. Detector address shall be accessible from fire-alarm control unit and shall be able to identify the detector's location within the system and its sensitivity setting.
 2. An operator at fire-alarm control unit, having the designated access level, shall be able to manually access the following for each detector:
 - a. Primary status.
 - b. Device type.
 - c. Present average value.
 - d. Present sensitivity selected.
 - e. Sensor range (normal, dirty, etc.).
- D. Ionization Smoke Detector:
1. Detector address shall be accessible from fire-alarm control unit and shall be able to identify the detector's location within the system and its sensitivity setting.
 2. An operator at fire-alarm control unit, having the designated access level, shall be able to manually access the following for each detector:
 - a. Primary status.
 - b. Device type.
 - c. Present average value.
 - d. Present sensitivity selected.
 - e. Sensor range (normal, dirty, etc.).

- E. Duct Smoke Detectors: Photoelectric type complying with UL 268A.
 - 1. Detector address shall be accessible from fire-alarm control unit and shall be able to identify the detector's location within the system and its sensitivity setting.
 - 2. An operator at fire-alarm control unit, having the designated access level, shall be able to manually access the following for each detector:
 - a. Primary status.
 - b. Device type.
 - c. Present average value.
 - d. Present sensitivity selected.
 - e. Sensor range (normal, dirty, etc.).
 - 3. Weatherproof Duct Housing Enclosure: NEMA 250, Type 4X; NRTL listed for use with the supplied detector for smoke detection in HVAC system ducts.
 - 4. Each sensor shall have multiple levels of detection sensitivity.
 - 5. Sampling Tubes: Design and dimensions as recommended by manufacturer for specific duct size, air velocity, and installation conditions where applied.
 - 6. Relay Fan Shutdown: Fully programmable relay rated to interrupt fan motor-control circuit.

2.7 NONSYSTEM SMOKE DETECTORS

- A. General Requirements for Nonsystem Smoke Detectors:
 - 1. Nonsystem smoke detectors shall be listed as compatible with the fire-alarm equipment installed or shall have a contact closure interface listed for the connected load.
 - 2. Nonsystem smoke detectors shall meet the monitoring for integrity requirements in NFPA 72.
- B. Single-Station Duct Smoke Detectors:
 - 1. Comply with UL 268A; operating at 120-V ac.
 - 2. Sensor: LED or infrared light source with matching silicon-cell receiver.
 - a. Detector Sensitivity: Smoke obscuration between 2.5 and 3.5 percent/foot when tested according to UL 268A.
 - 3. Base Mounting: Detector and associated electronic components shall be mounted in a twist-lock module that connects to a fixed base. The fixed base shall be designed for mounting directly to air duct. Provide terminals in the fixed base for connection to building wiring.
 - a. Weatherproof Duct Housing Enclosure: NEMA 250, Type 4X; listed for use with the supplied detector.
 - 4. Sampling Tubes: Design and dimensions as recommended by manufacturer for specific duct size, air velocity, and installation conditions where applied.
 - 5. Relay Fan Shutdown: Rated to interrupt fan motor-control circuit.

2.8 NOTIFICATION APPLIANCES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Cooper Wheelock.
 - 2. GAMEWELL.
- B. General Requirements for Notification Appliances: Connected to notification-appliance signal circuits, zoned as indicated, equipped for mounting as indicated, and with screw terminals for system connections.
 - 1. Combination Devices: Factory-integrated audible and visible devices in a single-mounting assembly, equipped for mounting as indicated, and with screw terminals for system connections.
- C. Chimes, Low-Level Output: Vibrating type, 75-dBA minimum rated output.

- D. Chimes, High-Level Output: Vibrating type, 81-dBA minimum rated output.
- E. Horns: Electric-vibrating-polarized type, 24-V dc; with provision for housing the operating mechanism behind a grille. Comply with UL 464. Horns shall produce a sound-pressure level of 90 dBA, measured 10 feet from the horn, using the coded signal prescribed in UL 464 test protocol.
- F. Visible Notification Appliances: Xenon strobe lights complying with UL 1971, with clear or nominal white polycarbonate lens mounted on an aluminum faceplate. The word "FIRE" is engraved in minimum 1-inch-high letters on the lens.
 - 1. Rated Light Output:
 - a. 15/30/75/110 cd, selectable in the field.
 - 2. Mounting: Wall mounted unless otherwise indicated.
 - 3. For units with guards to prevent physical damage, light output ratings shall be determined with guards in place.
 - 4. Flashing shall be in a temporal pattern, synchronized with other units.
 - 5. Strobe Leads: Factory connected to screw terminals.
 - 6. Mounting Faceplate: Factory finished, white.
- G. Voice/Tone Notification Appliances:
 - 1. Comply with UL 1480.
 - 2. Speakers for Voice Notification: Locate speakers for voice notification to provide the intelligibility requirements of the "Notification Appliances" and "Emergency Communications Systems" chapters in NFPA 72.
 - 3. High-Range Units: Rated 2 to 15 W.
 - 4. Low-Range Units: Rated 1 to 2 W.
 - 5. Mounting: [Flush] [semirecessed] [or] [surface mounted and bidirectional].
 - 6. Matching Transformers: Tap range matched to acoustical environment of speaker location.

2.9 REMOTE ANNUNCIATOR

- A. Description: Annunciator functions shall match those of fire-alarm control unit for alarm, supervisory, and trouble indications. Manual switching functions shall match those of fire-alarm control unit, including acknowledging, silencing, resetting, and testing.
 - 1. Mounting: Flush cabinet, NEMA 250, Type 1.
- B. Display Type and Functional Performance: Alphanumeric display and LED indicating lights shall match those of fire-alarm control unit. Provide controls to acknowledge, silence, reset, and test functions for alarm, supervisory, and trouble signals.

2.10 ADDRESSABLE INTERFACE DEVICE

- A. General:
 - 1. Include address-setting means on the module.
 - 2. Store an internal identifying code for control panel use to identify the module type.
 - 3. Listed for controlling HVAC fan motor controllers, fire pumps, and emergency generators for monitoring status
- B. Monitor Module: Microelectronic module providing a system address for alarm-initiating devices for wired applications with normally open contacts.
- C. Integral Relay: Capable of providing a direct signal to elevator controller to initiate elevator recall.
 - 1. Allow the control panel to switch the relay contacts on command.
 - 2. Have a minimum of two normally open and two normally closed contacts available for field wiring.

- D. Control Module:
 - 1. Operate notification devices.
 - 2. Operate solenoids for use in sprinkler service.

2.11 DIGITAL ALARM COMMUNICATOR TRANSMITTER

- A. Digital alarm communicator transmitter shall be acceptable to the remote central station and shall comply with UL 632.
- B. Functional Performance: Unit shall receive an alarm, supervisory, or trouble signal from fire-alarm control unit and automatically capture two telephone line(s) and dial a preset number for a remote central station. When contact is made with central station(s), signals shall be transmitted. If service on either line is interrupted for longer than 45 seconds, transmitter shall initiate a local trouble signal and transmit the signal indicating loss of telephone line to the remote alarm receiving station over the remaining line. Transmitter shall automatically report telephone service restoration to the central station. If service is lost on both telephone lines, transmitter shall initiate the local trouble signal.
- C. Local functions and display at the digital alarm communicator transmitter shall include the following:
 - 1. Verification that both telephone lines are available.
 - 2. Programming device.
 - 3. LED display.
 - 4. Manual test report function and manual transmission clear indication.
 - 5. Communications failure with the central station or fire-alarm control unit.
- D. Digital data transmission shall include the following:
 - 1. Address of the alarm-initiating device.
 - 2. Address of the supervisory signal.
 - 3. Address of the trouble-initiating device.
 - 4. Loss of ac supply.
 - 5. Loss of power.
 - 6. Low battery.
 - 7. Abnormal test signal.
 - 8. Communication bus failure.
- E. Secondary Power: Integral rechargeable battery and automatic charger.
- F. Self-Test: Conducted automatically every 24 hours with report transmitted to central station.

2.12 NETWORK COMMUNICATIONS

- A. Provide network communications pathway per manufacturer's written requirements and requirements in NFPA 72 and NFPA 70.
- B. Provide integration gateway using BACnet for connection to building automation system.

2.13 DEVICE GUARDS

- A. Description: Welded wire mesh of size and shape for the manual station, smoke detector, gong, or other device requiring protection.
 - 1. Factory fabricated and furnished by device manufacturer.
 - 2. Finish: Paint of color to match the protected device.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and conditions for compliance with requirements for ventilation, temperature, humidity, and other conditions affecting performance of the Work.
 - 1. Verify that manufacturer's written instructions for environmental conditions have been permanently established in spaces where equipment and wiring are installed, before installation begins.
- B. Examine roughing-in for electrical connections to verify actual locations of connections before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 ELECTRIC POWER

- A. Provide primary power for all fire alarm panel equipment from the emergency AC service to the building where shown on the drawings. Power shall be 120 VAC service, transformed through a two-winding, isolation type transformer and rectified to low voltage DC for operation of all circuits and devices. Make the service connection for the fire alarm panel equipment at the junction box labeled "FACP Connection" connected to the emergency distribution panel where shown. The circuit breaker shall be painted red, marked "Fire Alarm Control Circuit" and shall be provided with a lockable handle or cover. All 120 VAC primary power circuits shall be equipped with surge protection devices (SPD).

3.3 SYSTEM FIELD WIRING

- A. Wiring within Cabinets, Enclosures, Boxes, Junction Boxes and Fittings:
 - 1. Provide wiring installed in a neat and workmanlike manner and installed parallel with or at right angles to the sides and back of any box, enclosure or cabinet.
 - 2. Connect conductors which are terminated, spliced, or otherwise interrupted in any enclosure, cabinet, mounting or junction box, to terminal blocks.
 - 3. Mark each terminal in accordance with the wiring diagrams of the system. Make all connections with approved pressure type terminal blocks, which are securely mounted.
 - 4. Wire nuts and similar devices are not acceptable.
- B. Provide a terminal cabinet where indicated on the Drawings.
 - 1. Use terminal sizes appropriate for the size of the wiring to be connected.
 - 2. Provide labeling of conductor terminations, and a diagram permanently mounted in the terminal cabinet, showing all conductors, their labels, their circuits and their interconnection.
 - 3. Provide terminal cabinets having 25 percent spare backbox space.
- C. Fire Alarm Wiring:
 - 1. Provide fire alarm circuits in accordance with the equipment manufacturer's requirements, NFPA 70 – National Electrical Code, specifically Article 760 and these Specifications. Provide wire size sufficient to prevent voltage drop problems.
 - 2. Circuits operating at 24 VDC shall not operate at less than 21.6 volts.
 - 3. Audio speaker circuits operating at 70.7 VRMS shall be designated to operate at less than 0.5 dB (12.5 percent) loss. Circuits operating at any other voltage shall not have a voltage drop exceeding 10 percent of nominal voltage.
 - 4. Install all conductors in minimum electrical-metallic tubing (EMT), with a minimum diameter of 3/4 inch.
 - 5. Use shielded wiring where recommended by the manufacturer. For shielded wiring, the shield shall be grounded at only one point, which shall be in or adjacent to the FACP. Treat the drain or shield wires as a fire alarm conductor, landed on terminal strips. The drain wire shall be sleeved or insulated to within 1 inch of its termination. T-taps are not permitted. Circuits to fan shutdown systems shall terminate in terminal cabinets within 3 feet of the controllers for those systems

D. Wiring Installation:

1. All alarm initiating devices and supervisory initiating devices shall be connected on Style 4 two (2) wire (Class B) Signaling Line Circuits (SLC). Unsupervised wiring (point wires) shall not be permitted. Parallel branch circuit wiring shall be permitted on the addressable SLCs.
2. All alarm indicating devices shall be connected on Style Y two (2) wire electrically supervised circuits and on a minimum of two active circuits.
3. Wiring to initiating and supervisory devices and to fire alarm annunciators shall be with two (2) conductor twisted size 16 solid copper UL listed fire alarm system wire, subject to manufacturer's recommendations.
4. Wiring to alarm indicating devices shall be with two (2) conductors twisted No. 14 AWG solid copper UL listed jacketed fire alarm system wire, subject to manufacturer's recommendations.
5. Power wiring, operating at 120 VAC minimum, shall be No. 12 AWG solid copper, 600 VAC rated THHN/THWN insulation.
6. All other wiring shall be solid copper No. 14 AWG minimum with 600 volt THHN insulation except as specifically noted.
7. No splicing of wires is permitted except on terminal blocks in annunciators, control panels or properly labeled terminal cabinets as shown on the drawings.
8. The use of wire nuts or similar type devices is not permitted.

E. Conductor Terminations:

1. All devices shall have terminals for each wiring connection.
2. No splicing of any type shall be permitted in pull boxes, to include crimp terminals.
3. No specific color coding is required for any circuit; however, labeling of any circuit at terminal blocks in terminal cabinets, FACP, and remote fire alarm control units shall be provided at each conductor connection.
4. Each conductor or cable shall have a permanent label to provide a unique and specific designation.
5. Each terminal cabinet, FACP and remote fire alarm control unit shall contain a laminated drawing which indicates each conductor, its label, circuit and terminal. The laminated drawing shall be neat, using 12 point lettering minimum size, and mounted within each cabinet, panel or unit so that it does not interfere with the wiring or terminals.
6. All wires shall be labeled at both ends.. Use plastic wire ties and wire tie mounts to ensure a neat quality appearance.

F. Conduit Installation:

1. Conceal all electrical conduits above suspended ceilings and behind walls, except in unfinished areas where conduit may be surface mounted, unless otherwise specified.
2. The use of metal clad (MC) cable is acceptable only in concealed spaces and only as allowed by other Codes, including channeled walls and above suspended ceilings. The MC Cable shall be installed and supported in accordance with NFPA 70-NEC.
3. MC cable is not acceptable for smoke control system wiring.
4. All exposed conduit shall be painted to match adjacent finish.

G. Conduit Size:

1. Both exposed and concealed conduit including risers up to 2 inches in diameter shall utilize compression type steel fittings and connectors.
2. Unless otherwise noted, all conduit provided shall be 3/4 inch minimum trade size.
3. Vertical risers shall be one inch diameter minimum.
4. Limited use of 1/2 inch conduit is permitted on horizontal runs when a reduced diameter is required for better concealment. Where necessary, 1/2 inch diameter flex conduit may be fished or used for concealed work. Provide plenum rated wiring conductors (Type FPLP) when flex conduit is used.

3.4 EQUIPMENT INSTALLATION

- A. Comply with NFPA 72, NFPA 101, and requirements of authorities having jurisdiction for installation and testing of fire-alarm equipment. Install all electrical wiring to comply with requirements in NFPA 70 including, but not limited to, Article 760, "Fire Alarm Systems."
1. Devices placed in service before all other trades have completed cleanup shall be replaced.

2. Devices installed but not yet placed in service shall be protected from construction dust, debris, dirt, moisture, and damage according to manufacturer's written storage instructions.
- B. Connecting to Existing Equipment: Verify that existing fire-alarm system is operational before making changes or connections.
 1. Connect new equipment to existing monitoring equipment at the supervising station.
- C. Install wall-mounted equipment, with tops of cabinets not more than 78 inches above the finished floor.
 1. Comply with requirements for seismic-restraint devices specified in Section 260548.16 "Seismic Controls for Electrical Systems."
- D. Manual Fire-Alarm Boxes:
 1. Install manual fire-alarm box adjacent to FACP.
 2. Mount manual fire-alarm box on a background of a contrasting color.
 3. The operable part of manual fire-alarm box shall be between 42 inches and 48 inches above floor level. All devices shall be mounted at the same height unless otherwise indicated.
- E. Smoke- Detector Spacing:
 1. Comply with the "Smoke-Sensing Fire Detectors" section in the "Initiating Devices" chapter in NFPA 72, for smoke-detector spacing.
 2. Smooth ceiling spacing shall not exceed 30 feet .
 3. Spacing of detectors for irregular areas, for irregular ceiling construction, and for high ceiling areas shall be determined according to Annex A or Annex B in NFPA 72.
 4. HVAC: Locate detectors not closer than 36 inches from air-supply diffuser or return-air opening.
 5. Lighting Fixtures: Locate detectors not closer than 12 inches from any part of a lighting fixture and not directly above pendant mounted or indirect lighting.
- F. Install a cover on each smoke detector that is not placed in service during construction. Cover shall remain in place except during system testing. Remove cover prior to system turnover.
- G. Duct Smoke Detectors: Comply with NFPA 72 and NFPA 90A. Install sampling tubes so they extend the full width of duct. Tubes more than 36 inches long shall be supported at both ends.
 1. Do not install smoke detector in duct smoke-detector housing during construction. Install detector only during system testing and prior to system turnover.
- H. Air-Sampling Smoke Detectors: If using multiple pipe runs, the runs shall be pneumatically balanced.
- I. Elevator Shafts: Coordinate temperature rating and location with sprinkler rating and location. Do not install smoke detectors in sprinklered elevator shafts.
- J. Remote Status and Alarm Indicators: Install in a visible location near each smoke detector, sprinkler water-flow switch, and valve-tamper switch that is not readily visible from normal viewing position.
- K. Audible Alarm-Indicating Devices: Install not less than 6 inches below the ceiling. Install bells and horns on flush-mounted back boxes with the device-operating mechanism concealed behind a grille. Install all devices at the same height unless otherwise indicated.
- L. Visible Alarm-Indicating Devices: Install adjacent to each alarm bell or alarm horn and at least 6 inches below the ceiling. Install all devices at the same height unless otherwise indicated.
- M. Device Location-Indicating Lights: Locate in public space near the device they monitor.

3.5 PATHWAYS

- A. Pathways above recessed ceilings and in nonaccessible locations may be routed exposed.

1. Exposed pathways located less than 96 inches above the floor shall be installed in EMT.
- B. Pathways shall be installed in EMT.
- C. Exposed EMT shall be painted to match adjacent finish.

3.6 CONNECTIONS

- A. For fire-protection systems related to doors in fire-rated walls and partitions and to doors in smoke partitions, comply with requirements in Section 087100 "Door Hardware." Connect hardware and devices to fire-alarm system.
 1. Verify that hardware and devices are listed for use with installed fire-alarm system before making connections.
- B. Make addressable connections with a supervised interface device to the following devices and systems. Install the interface device less than 36 inches from the device controlled. Make an addressable confirmation connection when such feedback is available at the device or system being controlled.
 1. Smoke dampers in air ducts of designated HVAC duct systems.
 2. Alarm-initiating connection to elevator recall system and components.
 3. Alarm-initiating connection to activate emergency lighting control.
 4. Supervisory connections at valve supervisory switches.

3.7 IDENTIFICATION

- A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- B. Install framed instructions in a location visible from fire-alarm control unit.

3.8 GROUNDING

- A. Ground fire-alarm control unit and associated circuits; comply with IEEE 1100. Install a ground wire from main service ground to fire-alarm control unit.
- B. Ground shielded cables at the control panel location only. Insulate shield at device location.

3.9 FIELD QUALITY CONTROL

- A. Field tests shall be witnessed by authorities having jurisdiction.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- C. Perform tests and inspections.
- D. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 1. Visual Inspection: Conduct visual inspection prior to testing.
 - a. Inspection shall be based on completed record Drawings and system documentation that is required by the "Completion Documents, Preparation" table in the "Documentation" section of the "Fundamentals" chapter in NFPA 72.
 - b. Comply with the "Visual Inspection Frequencies" table in the "Inspection" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72; retain the "Initial/Reacceptance" column and list only the installed components.

2. System Testing: Comply with the "Test Methods" table in the "Testing" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
 3. Test audible appliances for the public operating mode according to manufacturer's written instructions. Perform the test using a portable sound-level meter complying with Type 2 requirements in ANSI S1.4.
 4. Test visible appliances for the public operating mode according to manufacturer's written instructions.
 5. Factory-authorized service representative shall prepare the "Fire Alarm System Record of Completion" in the "Documentation" section of the "Fundamentals" chapter in NFPA 72 and the "Inspection and Testing Form" in the "Records" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
- E. Reacceptance Testing: Perform reacceptance testing to verify the proper operation of added or replaced devices and appliances.
- F. Fire-alarm system will be considered defective if it does not pass tests and inspections.
- G. Prepare test and inspection reports.
- H. Maintenance Test and Inspection: Perform tests and inspections listed for weekly, monthly, quarterly, and semiannual periods. Use forms developed for initial tests and inspections.
- I. Annual Test and Inspection: One year after date of Substantial Completion, test fire-alarm system complying with visual and testing inspection requirements in NFPA 72. Use forms developed for initial tests and inspections.

3.10 MAINTENANCE SERVICE

- A. Initial Maintenance Service: Beginning at Substantial Completion, maintenance service shall include 12 months' full maintenance by skilled employees of manufacturer's designated service organization. Include preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper operation. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.
1. Include visual inspections according to the "Visual Inspection Frequencies" table in the "Testing" paragraph of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
 2. Perform tests in the "Test Methods" table in the "Testing" paragraph of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
 3. Perform tests per the "Testing Frequencies" table in the "Testing" paragraph of the "Inspection, Testing and Maintenance" chapter in NFPA 72.

3.11 SOFTWARE SERVICE AGREEMENT

- A. Comply with UL 864.
- B. Technical Support: Beginning at Substantial Completion, service agreement shall include software support for two years.
- C. Upgrade Service: At Substantial Completion, update software to latest version. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system and new or revised licenses for using software.
1. Upgrade Notice: At least 30 days to allow Owner to schedule access to system and to upgrade computer equipment if necessary.

3.12 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain fire-alarm system.

END OF SECTION

SECTION 31 22 00 - EARTHWORK AND GRADING

PART 1 - GENERAL

1.1 SUMMARY:

- A. This section describes general requirements, products, and methods of execution relating to on-site earthwork. Any work within the public right-of-way shall be constructed to the standards of the City of Livermore and State of California Department of Transportation. Work includes, but is not limited to, the following:
1. Grading.
 2. Material.
 3. Excavation.
 4. Filling and backfilling.
 5. Soil Sterilant.
 6. Termiticide.
- B. Provide labor, material and equipment and services necessary to complete the excavations, re-compaction and finish grading as specified and indicated on Drawings.
1. Obtain permit from local authorities.
 2. Provide surveying for grading operations.
 3. Provide shoring design.
 4. Provide dewatering operations.
 5. Provide site grading, cut, fill and finish.
 6. Provide excavation and backfill for filling construction, including trenches within building lines.
 7. Preparation for subgrade for building slabs, walks, pavements, and landscaping.
 8. Provide distribution of stockpiled topsoil.
 9. Provide sub-base course for walks and pavements.
 10. Provide engineered fills for building slabs and foundations.
 11. Provide sand and gravel for capillary break/moisture barrier under building slabs.
 12. Provide sub-surface drainage backfill for walls and trenches.
- C. The work includes removal and legal disposal off the site of debris, rubbish and other materials resulting from clearing and grubbing operations.
1. Work specified in Related Sections:
 - a. Section 31 10 00 – SITE PREPARATION AND DEMOLITION.
 - b. Section 31 23 33 – TRENCHING, BACKFILLING, AND COMPACTING.
 - c. Section 34 47 27 – BIORETENTION

1.2 DEFINITIONS:

- A. Engineered Fill:
1. Soil or soil-rock material approved by District's Representative used by the Contractor in order to raise grades or to backfill excavations.
 2. The District's Testing Agency will make sufficient tests and/or observations for the purpose of issuing a written statement that material meets or exceeds the specification requirements.
- B. On-site Material: Soil or earth material obtained from required on-site excavation.
- C. Excavation: Consists of the removal of material encountered to subgrade elevations and the re-use or disposal of materials removed.
- D. Subgrade: The uppermost surface of an excavation or the top surface of a fill or backfill immediately below sub-base, drainage fill, rock base course, or topsoil materials.
- E. Import Material: Soil material obtained off-site when sufficient approved soil material is not available from excavations.

- F. Base Course: The layer placed between the sub-base and surface pavement in a paving system.
- G. Relative Compaction: In-place dry density of soil expressed as percentage of maximum dry density of same materials, as determined by laboratory test procedure American Society for Testing and Materials (ASTM) D1557.
- H. Overexcavation: Removal of material below required subgrade elevations.

1.3 SUBMITTALS:

- A. Comply with provisions of Section 01 33 00 – SUBMITTAL PROCEDURES.
- B. Product Data: Manufacturer's literature and data, including, where applicable, capacity, labels, or other markings on equipment made to the specified standards for materials, for the following:
 - 1. Imported materials.
 - 2. Class II aggregate base (Caltrans Section 26).
 - 3. Soil Sterilant.
 - 4. Termiticide.
 - 5. Cement Treatment.
 - 6. Geotextiles.
 - 7. Subdrainage Pipe.
- C. Test Reports: Submit the following reports for import material directly to Architect from the Contractor's testing services:
 - 1. Test reports on borrow material.
 - 2. Density test reports.
 - 3. One optimum moisture-maximum density curve for each type of soil encountered.
 - 4. Not used.
 - 5. Not used.
 - 6. Soil percolation rate test for soils to be used in storm water treatment zones.
 - 1)
- D. Shoring Design: Where shoring is required by State Law or Contractor shall provide necessary design, provide proposed excavation shoring method for review prior to commencement of excavation requiring shoring. Include the following information:
 - 1. Basic design assumptions.
 - 2. Design Calculations.
 - 3. Describe materials or shoring system to be used.
 - 4. Indicate whether or not any components will remain after filling or backfilling.
 - 5. The shop drawings for the proposed shoring system.
 - 6. Coordinate with the Construction Documents and identify any proposed modifications or deviations.
 - 7. Certification of the above by a registered professional civil or structural engineer licensed by the State of California.
 - 8. Submittal will be reviewed for general conformance with project plans, but no review of calculations will be provided.
- E. Dewatering Plan: Based upon site surface and subsurface conditions, including available geotechnical and hydrological data, provide a system to perform the following:
 - 1. Lower the ground water level below bottom of excavation.
 - 2. Relieve the hydrostatic pressure below the subgrade to prevent uplift.
 - 3. Prevent surface drainage from accumulating within work area.
 - 4. Legally discharge and dispose of excess water.
 - 5. Submit description of basic components of proposed dewatering system and its planned method of operation.
- F. Samples:
 - 1. 20-lb. samples sealed in air-tight containers, of each proposed fill and backfill soil material from on-site or borrow sources. Provide to Geotechnical Engineer as requested.

2. 20-lb samples sealed in air tight containers of specialty soils for submission to a plant and soil testing facility for analysis. Include perc test and sieve analysis.
- G. Pad Certification
 1. Submit a pad certification stamped by a California Licensed Land Surveyor.
- H. Storm Water Pollution Prevention / Erosion Control Plans/Water Pollution Control Plans
- I. Permit/Notice of Intent (N.O.I.), for discharge of storm run-off from the construction site.
- J. Haul Routes.

1.4 ASSURANCE:

- A. Requirements of Regulatory Agencies:
 1. Comply with State of California Business and Transportation Agency, California Department of Transportation (CDT, Caltrans) "Standard Specifications" (Caltrans Standard Specification).
 2. Comply with State of California Code of Regulations (CCR).
 3. Comply with State of California Construction Safety Orders, Latest Edition (CAL/OSHA).
 4. City of Livermore Department of Public Works, Standards and Specifications and Drawings, latest edition.
 5. BCDC, ACOE, Fish and Wildlife, if applicable.
- B. Soil Testing:
 1. District will engage a geotechnical testing agency, to include testing soil materials proposed for use in the work and for quality control testing during excavation and fill operations.
 2. Test results will be distributed in compliance with Section 014523 – TESTING AND INSPECTION SERVICES.
- C. Codes and Standards:
 1. Perform excavation work in compliance with applicable requirements of authorities having jurisdiction.
 2. Statewide General Permit to Discharge Storm Water associated with construction activity.
 3. The project Storm Water Pollution Prevention and Monitoring Plan.
- D. Comply with the latest editions of the following Standards and Regulations:
 1. American Society for Testing and Materials (ASTM):
 - a. Concrete Aggregates.
 - b. C125: Standard Terminology Relating to Concrete and Concrete Aggregates.
 - c. C136: Sieve Analysis of Fine and Coarse Aggregates.
 - d. C566: Total Evaporable Moisture Content of Aggregate by Drying.
 - e. D421: Dry Preparation of Soil Samples for Particle-Size Analysis and Determination of Soil Constants.
 - f. D422: Particle Size Analysis of Soil.
 - g. D854: Specific Gravity of Soils.
 - h. D1556: Density of Soil by the Sand Cone Method.
 - i. D1557: Laboratory Compaction Characteristics of Soil Using Modified Effort
 - j. D2216: Determination of Water (Moisture) Content of Soil, Rock, and Soil-Aggregate Mixtures.
 - k. D2487: Classification of Soils for Engineering Purposes.
 - l. D2922: Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
 - m. D2937: Density of Soil in Place by Drive Cylinder Method.
 - n. D3017: Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth).
 - o. D4318: Liquid Limit, Plastic Limit, and Plasticity Index of Soils.
 2. California Code of Regulations, Title 24, Part 2 - Basic Building Regulations, Chapter 24 - Excavations, Foundations, and Retaining Walls.
 3. California Department of Transportation (Caltrans) Standard Specifications:
 - a. Section 10: Watering.
 - b. Section 18: Dust Palliatives.

- c. Section 19: Earthwork.
 - 4. CAL/OSHA, Title 8.
 - 5. City of Livermore Standard Plans and Specifications
 - 6. Other authorities having jurisdiction

- E. Geotechnical Engineering Services:
 - 1. Geotechnical Engineer shall be provided by the District or Contractor, as the District's Representative to observe grading observations during preparation offsite, excavation, and compaction of fill materials.
 - 2. Make visits to site to familiarize him generally with progress and quality of work.
 - 3. Make field observations and tests to enable him to form opinions regarding adequacy of site preparation, acceptability of fill materials and extent to which earthwork construction and relative compaction comply with specifications requirements.
 - 4. Examine conditions exposed in foundation excavations.

- F. Site Information:
 - 1. Geotechnical Investigation Reports are available for examination by Contractor.
 - 2. Additional soil borings and other exploratory operations may be made by Contractor at no cost to the District. Submit proposed boring locations for review prior to performing the work.

- G. Contractor Qualifications:
 - 1. Have successfully installed structural soil mixes similar to the quality specified for a period of not less than 5 years.

1.5 DELIVERY, STORAGE, AND HANDLING:

- A. Protect materials of this section before, during and after installation; objects designated to be retained; and the installed work of other trades.

- B. In the event of damage to any of these items, immediately make repairs or replacements necessary to the acceptance of the District's Representative and at no additional cost to the District.

- C. Comply with provisions of Section 015000 – TEMPORARY FACILITIES AND CONTROLS where necessary to control dust and noise on and near the work caused by operations during performance of the Work

1.6 PROJECT CONDITIONS:

- A. Site Information: Review the geotechnical report identified in Section 02 30 00 – SUBSURFACE INVESTIGATION.
 - 1. The character of the material to be excavated or used for subgrade is not necessarily as indicated.
 - 2. Ground water elevations indicated are those existing at the time subsurface investigations were made and do not necessarily represent ground water elevation at the time of construction.

- B. Environmental Requirements:
 - 1. Comply with the project SWPPP.
 - 2. When unfavorable weather conditions necessitate interrupting filling and grading operations, prepare areas by compaction of surface and grading to avoid collection of water.
 - 3. Provide adequate temporary drainage to prevent erosion.
 - 4. After interruption, reestablish compaction specified in last layer before resuming work.
 - 5. Protect existing storm drainage system from silt and debris resulting from construction activities. If contamination occurs, remove contamination at no cost to the District.
 - 6. Protect existing streams, ditches and storm drain inlets from water-borne soil by means of straw bale dikes, filter fiber dams, or other methods.

- C. Protections of open excavations.

1. Barricade open excavations and post with warning lights.
 2. Comply with requirements of Section 01 50 00 –TEMPORARY FACILITIES AND CONTROLS.
 3. Operate warning lights as recommended by authorities having jurisdiction.
 4. Protect structures, utilities, sidewalks, pavements, and other facilities immediately adjacent to excavations, from damages caused by settlement, lateral movement, undermining, washout and other hazards.
- D. Protection of Subgrade
1. Protection of Subgrade: Do not allow equipment to pump or rut subgrade, stripped areas, footing excavations, or other areas prepared for project.
 2. At Contractor's option, and with the Geotechnical Engineer's approval, a working pad of granular material may be laid to protect footing and floor subgrade soils from disruption by traffic during wet conditions.
- E. Transport of soils.
1. Transport all excess soils materials by legally approved methods to disposal areas.
 2. Coordinate with the District's Representative.
 3. Sufficient topsoil and fill material shall be retained from the site to complete project requirements.
 4. Any additional topsoil and fill requirements shall be the responsibility of the Contractor.
- F. Blasting and use of explosives will not be permitted.
- G. Dust Control Requirements: At all times during earthwork operations and until final completion and acceptance of the earthwork, the Contractor shall prevent the formation of an airborne dust and dirt nuisance from interfering with the surrounding normal operations. The Contractor shall effectively stabilize the site of work in such a manner that it will confine dust particles to the immediate surface of the work and to obtain a minimum of 40 percent emissions reduction by applying a dust palliative except in areas of active cut and fill. The dust palliative shall be non-petroleum based. Water alone is not considered to be a dust palliative. The dust palliative shall be applied at the rate and method in conformance with Section 18, "Dust Palliatives," of the Caltrans Standard Specifications and as recommended and/or specified by the manufacturer. Contractor shall assume liability for all claims related to dust and dirt nuisances.
- H. All areas to receive Structural Soil shall be inspected by the District's Representative prior to beginning this work.

1.7 EXISTING UTILITIES

- A. The District will contact local utility agencies prior to construction and arrange for the shut-off of all utilities serving the buildings to be demolished. Coordinate work required to abandon active lines with the Program Manager and the District.
- B. Locate existing underground utilities in the areas of work. If utilities are to remain in place, provide adequate means of protection during excavation operations.
- C. Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, consult the District's Representative immediately for directions.
1. Cooperate with the District and public and private utility companies in keeping their respective services and facilities in operation.
 2. Repair damaged utilities to the satisfaction of the District's Representative.
- D. Do not interrupt existing utilities serving facilities occupied and used by the District or others, except when permitted in writing by the District and then only after acceptable temporary utility services have been provided.

1.8 SEQUENCING AND SCHEDULING:

- A. The schedule of operations shall be reviewed by the District's Representative prior to commencement of any work.
- B. Coordinate operations with other construction activities, such as relocation of existing utilities.

PART 2 - PRODUCTS

2.1 MATERIALS:

- A. General:
 - 1. Fill material will be subject to approval of the Geotechnical Engineer.
 - 2. For approval of imported fill material, notify the District's Representative at least 7 days in advance of intention to import material, designated proposed borrow area, and permit the Geotechnical Engineer to sample as necessary from borrow area for purpose of making acceptance tests to prove quality of material.
 - 3. The Geotechnical Engineer's report on acceptability shall be final and binding.
 - 4. During grading operations, soil types other than those analyzed in the geotechnical report for the project, may be encountered.
 - 5. Consult the Geotechnical Engineer to determine the suitability of these soils.
- B. Engineered Fill Material: Soil excavated from site (native) or imported conforming to requirements for fill material contained in geotechnical report for this project.
- C. Native Fill Requirements:
 - 1. Approved native materials shall have a particle size not exceeding 3 inches as determined by ASTM D422, at least 90 percent by weight passing the 1 inch sieve and less than 3 percent organic content by weight.
- D. Imported Fill Requirements: Imported fill, where required, shall be non expansive granular soil, free of organic matter and deleterious substances. Imported fill material shall conform to the following requirements:
 - 1. Grading:

<u>U. S. Sieve Size</u>	<u>Percentage Passing Sieve</u>
2 ½ inch	100
No. 8	25-45
No. 200	0-100
 - 2. Be thoroughly compactable without excessive voids.
 - 3. Meet the following plasticity requirements:
 - a. Maximum Plasticity Index of 12, as determined by ASTM D4318.
 - b. Maximum Liquid Limit of 35, as determined by ASTM D4318.
- E. Imported Fill for Planting Areas: Imported fill for use in planting areas shall be sandy loam weed free soil. Submit analysis from certified Soil and Plant Lab. Coordinate with Landscape Architect.
- F. Topsoil: Friable clay loam surface soil found in a depth of not less than 10 inches. Satisfactory topsoil is reasonably free of subsoil, clay lumps, stones and other objects over 2 inches in diameter, and without weeds, roots and other objectionable material.
 - 1. Use topsoil for top 2 feet of fill against exterior walls, except at paving and sidewalks.
 - 2. Topsoil may also be used beyond the area within 5 feet of building, except under paving and sidewalks.
 - 3. Confirm suitability of stockpiled materials.
- G. Sand: Clean, well-graded fine to coarse sand with not more than 2 percent passing the #200 sieve based on wet sieve analysis. Provide at locations indicated in the construction documents.
 - 1. Where coarse sand is required, provide sand no finer than No.40 sieve.
- H. Bioretention Soil Mixture

1. Follow Appendix L of the Municipal Regional Permit
 - I. Drain Rock:
 1. Washed, uniformly graded mineral aggregate ASTM D448 with percentage composition of dry weight conforming to following limits:
 - a. Passing 1-inch Sieve: 100 percent.
 - b. Passing 3/4-inch Sieve: 90-100 percent.
 - c. Passing No. 4 Sieve: 0-10 percent.
 2. Base at Slab-on-Grade: As specified in the geotechnical report for this project.
 3. Absorption of water to saturated-surface dry condition shall not exceed 3 percent of oven-dry weight of a sample.
 - J. Backfill material for use behind retaining walls shall be a granular material consisting of sand, broken rock, or a mixture of sand and gravel containing no size larger than 2 ½ inches and not more than 15 percent passing the No. 200 sieve.
 - K. Pea Gravel: 3/8 inch to ½ inch washed, uncrushed gravel. Use at drainage pipe and at other locations indicated.
 - L. Filter Fabric: Provide filter fabrics that meet or exceed the listed minimum physical properties determined according to ASTM D4759 and the referenced standard test method in parentheses.
 1. Grab Tensile Strength (ASTM D4632): 120 lb.
 2. Apparent Opening Size (ASTM D4751): #70 U.S. Standard sieve.
 3. Permeability (ASTM D4491): 135 gallons per minute per square foot.
 - M. Drainage Pipe:
 1. Perforated corrugated plastic drainage tubing meeting ASTM F667, with continuous integral nylon filter screen.
 2. Acceptable Manufacturers and Products: Advanced Drainage Systems "DrainGuard," Hancor "Agri-Flow."
 3. Provide couplings, elbows and other fittings as recommended by pipe manufacturer.
 - N. Water: Clean and free from deleterious amounts of acids, alkalis, salts and organic matter.

2.2 SOIL STERILANT:

- A. Soil Sterilant shall be Treflan E.C. or approved equivalent.

2.3 TERMITICIDE:

- A. Termiticide shall be Permethrin, Denon, or approved equivalent.

PART 3 - EXECUTION

3.1 GENERAL:

- A. Prior to commencement of earthwork, become thoroughly familiar with site conditions.
- B. If event discrepancies are found, immediately notify the [District's/Owner's] Representative in writing, indicating the nature and extent of differing conditions.
- C. Requirements:
 1. Grades and elevations are to be established with reference to benchmarks referenced on Drawings.
 2. Maintain engineering markers such as monuments, benchmarks and location stakes. If disturbed or destroyed, replace.

- D. No earthwork shall be performed without physical presence or acceptance of the Geotechnical Engineer.
- E. The Geotechnical Engineer's acceptance is required by these specifications; notify the District's Representative at least 48 hours prior to commencing any phase of earthwork.
 - 1. No phase of work shall proceed until prior phase has been accepted by the Geotechnical Engineer.
 - 2. Work shall not be covered up or continued until acceptance of the Geotechnical Engineer shall give written notice of conformance with the specifications upon completion of grading.
- F. Compacting:
 - 1. Compact by power tamping, rolling or combinations thereof as accepted by the Geotechnical Engineer.
 - 2. Where impractical to use rollers in close proximity to walls, stairs, etc., compact by mechanical tamping.
 - 3. Scarify and re-compact any layer not attaining compaction until required density is obtained.
 - 4. Compaction by flooding, ponding or jetting will not be permitted, unless specifically accepted by the Geotechnical Engineer.
- G. Hazardous Materials
 - 1. If any materials are encountered that may be hazardous (as defined in Section 25117 of the California Health and Safety Code), inform the [District's/Owner's] Representative verbally within 24 hours and in writing within 2 business days. Upon discovery, material is to remain undisturbed until investigation by State's representative is complete. The removal and disposal of hazardous materials, if discovered, is not part of the scope of work of this Division for this project.

3.2 SITE PREPARATION:

- A. Protect structures, utilities, sidewalks, pavements, and other facilities which are to remain from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earthwork operations. Set up tree protection measures prior to commencing grading or demolition operations.
- B. Clearing and Grubbing:
 - 1. Remove from area of designated project earthwork all improvements and obstructions, including designated concrete curbs or slabs, asphaltic concrete, all tree and shrub roots, any buried utility and irrigation lines, and other matter determined by the Geotechnical Engineer to be deleterious.
 - a. In all new planting areas, remove existing base material.
 - b. Use only hand methods for grubbing inside the drip line of trees indicated to be left standing.
 - 2. Remove from the site all trees and shrubs, unless otherwise indicated on the drawings as existing trees to be left standing.
 - 3. Remove or fill existing basements left from removed structures as appropriate to areas. Compact in accordance with requirements of these specifications.
 - 4. Removed material shall become property of the Contractor and shall be removed from site, unless otherwise indicated on the drawings or specified herein.
 - 5. Holes resulting from removal of underground obstructions that extend below finish grades shall be cleared and backfilled with engineered fill.
 - 6. Existing Trees to remain:
 - a. Verify the locations of existing trees to be preserved.
 - b. Replace existing trees to remain that are damaged during construction at no additional cost to the District.
 - c. Carefully make clean cuts at roots and branches of trees indicated to be left standing, where such roots and branches obstruct new construction. Paint cuts over ½ inch in size with tree pruning compound.
- C. Topsoil:

1. Strip topsoil to whatever depths encountered in manner to prevent intermingling with the underlying subsoil or other objectionable material.
2. Remove heavy growths of grass from areas before stripping. Where trees are indicated to be left standing, stop topsoil stripping a sufficient distance to prevent damage to the main root system.
3. Stockpile topsoil in storage piles to freely drain surface water.
4. Cover storage piles if required to prevent windblown dust.

3.3 EXISTING UTILITIES:

- A. Protect existing utilities that are to remain in operation as specified.
- B. Demolish and completely remove from the site existing underground utilities indicated to be removed. See Section 311000 – SITE PREPARATION AND DEMOLITION.
- C. Movement of construction machinery and equipment over existing pipes and utilities during construction shall be at contractor's risk.
- D. Excavation made with power-driven equipment is not permitted within 2 feet of any known utility or subsurface structure.
 1. Use hand or light equipment for excavating immediately adjacent to or for excavations exposing a utility or buried structure.
 2. Start hand or light equipment excavation on each side of the indicated obstruction and continue until the obstruction is uncovered or until clearance for the new grade is assured.
 3. Support uncovered lines or other existing work affected by excavation until approval for backfill is obtained.
 4. Report damage of utility line or subsurface structures immediately to the District's Representative.

3.4 PREPARATION OF SUBGRADE:

- A. Expansive soils are anticipated at the site.
 1. To help mitigate expansive soil problems, over-excavate and replace the upper 12 inches of building pad subgrade with properly compacted soil with a Plasticity Index of 12 or less.
 2. Review the necessity for over-excavation of expansive soils once the final excavation depth has been determined.
 3. Include a plastic vapor retarder with a 2-inch thick sand cushion placed above the vapor retarder.
 4. A layer of clean gravel or crushed rock at least 4 inches thick should underlie the vapor retarder. The crushed rock shall have 100 percent passing the ¾-inch sieve and less than 5 percent passing the No. 4 sieve.
- B. Scarify building pad, exterior flatwork and pavement subgrade to a depth of at least 8 inches and work until uniform and free from large clods.
 1. Bring expansive subgrades to not less than 3 percentage points above optimum moisture content (not less than 2 percentage points above optimum upper 6 inches of pavement subgrade) and compact to 90 percent of the maximum laboratory dry density, in accordance with ASTM D1557.
 2. Bring non-expansive subgrades to or slightly above the optimum moisture content and compact to 90 percent of the maximum laboratory dry density in accordance with ASTM D1557.
 3. Increase compaction of the upper 6 inches of pavement subgrades to 95 percent of the maximum laboratory dry density and at least 2 percent over the optimum moisture content per ASTM D1557 for non-expansive subgrades.

3.5 DEWATERING:

- A. Do not allow water from surface drainage or underground sources to accumulate in excavations, unfinished fills, or other low areas.

- B. Provide and maintain ample means and devices to remove water promptly and dispose properly of water entering excavations or other parts of the work to prevent softening of exposed surfaces.
- C. Dewater by methods which will ensure dry excavation and preservation of finish lines and grades of excavation bottoms.
- D. Prior to excavating below ground water level, place dewatering system in operation.
 - 1. Lower the ground water level a minimum of 1 foot below the bottom of the excavation.
 - 2. Relieve the hydrostatic pressure in pervious zones below the subgrade elevation to prevent uplift.
 - 3. Use screens and gravel packs as necessary to prevent removal of fines from the soil.
- E. Operate the dewatering system continuously, 24 hours a day, 7 days a week until construction work below existing ground water level is completed.
 - 1. Measure and record the performance of the dewatering system.
 - 2. After placement of initial slabs and backfill, the ground water level may be allowed to rise.
 - 3. At no time allow ground water to rise higher than 1 foot below the prevailing level of excavation or backfill.
 - 4. Have a back-up pump and system available for immediate use.
- F. Dispose of water away from the work in suitable manner without damage to adjacent property or menace to public health.
- G. Do not drain water into work being built or under construction without prior acceptance of the District's Representative.
- H. Protect existing storm drainage system from silt and debris resulting from construction activities. If contamination occurs, remove contamination at no cost to the District.

3.6 SITE EXCAVATION:

- A. General
 - 1. All supports, shoring, and sheet piling required for the sides of excavations or for protection of adjacent existing improvements shall be provided and maintained by the Contractor. The adequacy of such systems shall be the complete responsibility of the Contractor.
 - 2. Earth and rock, regardless of character and subsurface conditions, shall be excavated to depths shown on drawings and to the neat dimensions of the footings wherever practicable, to permit pouring of footings and grade beams without use of side forms, except at slab perimeters.
 - 3. Large rocks, pieces of concrete or other obstructions, if encountered during the excavation/scarifying operations, shall be removed and disposed of by the Contractor off the site in a legal manner.
 - 4. Where footing excavation is too deep, backfill shall be concrete. Where footings are over dug laterally, side forms shall be employed for backfill with rock fill or concrete backfill shall be used (Contractor's option).
 - 5. Where forming is required, only that excavation necessary to permit placing and removal of forms shall be done.
 - 6. Bottoms of all footings and foundations trenches shall be subject to testing by the Geotechnical Engineer. Corrective measures as directed by the State's representative shall be executed promptly.
- B. Excavate subgrade as required to allow for finish grades shown on drawings, as required for structural fill or otherwise required for proper completion of the work.
- C. Remove and replace subgrade materials designated by Geotechnical Engineer as unsuitable.

3.7 FILL AND COMPACTING:

- A. General Requirements:
 - 1. Backfill excavations as promptly as work permits.
 - 2. Do not place engineered fill or backfill until rubbish and deleterious materials have been removed and areas have been approved by the District's Representative.
 - 3. Place acceptable soil material in layers to required subgrade elevations, for each area classification listed below.
 - 4. In excavations, use satisfactory excavated or borrow material.
 - 5. Under grassed areas, use satisfactory excavated or borrow material.
- B. After subgrade compaction has been approved by the Geotechnical Engineer, spread the engineered fill materials in lifts not exceeding 8 inches and uniformly mixed during the spreading operation.
 - 1. Bring non-expansive fill materials to or slightly above the optimum moisture content and compact to at least 90 percent of the maximum laboratory dry density, per ASTM D1557.
 - 2. Bring non-expansive aggregate fill materials to or slightly above the optimum moisture content and compact to at least 95 percent of the maximum laboratory dry density, per ASTM D1557.
 - 3. Do not compact the top 12 inches of soil in the planting areas.
 - 4. Fill sections greater than 5 feet in depth shall be compacted to at least 95 percent relative compaction per ASTM D1557.
- C. Repeat compaction procedure until proper grade is attained.
- D. Rocks generated during site earthwork may be used in fill when conforming to material specifications.

3.8 MOISTURE CONTROL:

- A. Do not place, spread or roll fill material during unfavorable weather conditions or when fill material is excessively wet.
- B. Do not resume operations until moisture content and fill density are satisfactory to the Geotechnical Engineer.
- C. Provide berms or channels to prevent surface water from flooding excavations. Promptly remove water collecting in depressions.
- D. Where soil has been softened or eroded by flooding or by placement during unfavorable weather, remove damaged areas and re-compact as described for fill and compaction.
- E. Where subgrade or layer of soil material must be moisture conditioned before compaction, uniformly apply water to surface of subgrade, or layer of soil material.
 - 1. Prevent free water appearing on surface during or subsequent to compaction operation.
 - 2. Remove and replace, or scarify and air dry, soil material too wet to permit compaction to specified density.
 - 3. Soil material removed because it is too wet to permit compaction may be stockpiled or spread and allowed to dry. Assist drying by discing, harrowing or pulverizing until moisture content is reduced to a satisfactory value.

3.9 GRADING:

- A. General: Uniformly grade areas of work including adjacent transition areas. Smooth finished surface within specified tolerances, compact with uniform levels or slopes between points where elevations are shown, or between such points and existing grades.
 - 1. All areas covered by the project, including excavated and filled areas and adjacent transition areas, shall be uniformly graded so that finished surfaces are at the elevations established by the plans. Planter areas to receive future topsoil shall be graded below finished grade to allow for such material.
 - 2. Finished surfaces and surfaces to receive paving and aggregate base shall be smooth, compacted, and free from irregular surface drainage.

3. Ditches, gutters, and swales shall be finished to permit proper surface drainage.
 4. All surface areas, except paved and sloped embankments exceeding 8:1, shall be hydroseeded in accordance with specifications in Landscaping Sections.
- B. Grading Tolerances:
1. Excavations shall not exceed 0.10-foot variation from dimensions and elevations shown or noted, unless otherwise approved by the District's Representative.
 2. Fill and backfill shall be placed with tolerance of plus or minus 0.10 foot if placed in layers.
 3. Grading shall be done within plus or minus 0.10 foot typically; areas under slabs, walks or pavements shall be graded within tolerance of 0 to 0.10 foot.
 4. Lawn or Unpaved Areas: Finish areas to receive topsoil to within not more than 0.10 foot above or below required subgrade elevations.
 5. Walks: Shape surface of areas under walks to line, grade and cross-section, with finish surface not more than 0.10 foot above or below required subgrade elevation.
 6. Pavements: Shape surface of areas under pavement to line, grade and cross-section, with finish surface not more than ½ inch above or below required subgrade elevation.
- C. Compaction: After grading, compact subgrade surfaces to the depth and percentage of maximum density for each area classification.

3.10 SOIL STERILIZATION:

- A. General: Soil sterilant shall be applied to prepared subgrade or after installation of rock or aggregate base as recommended by the manufacturer. Sterilant shall be applied uniformly at the rate recommended by the manufacturer to all areas beneath asphalt concrete pavement, brick pavement, concrete pavement, or on-grade concrete slabs including sidewalks, curbs, and gutters and areas between the inner and outer security fences. In addition to ground areas treated, sterilant shall be applied below expansion or control joints, and at all areas where pipe, ducts, or other features penetrate slabs.

3.11 BIORETENTION SOIL MIXTURE

- A. General: Soil material installed in bio-retention and bio-swales shall be tested in-site to verify the field conditions meet performance requirements.
- B. Installation: Place soil material in lifts not exceeding 8-inches. Compact to between 83 and 87 percent relative compaction.
- C. Testing: Demonstrate in-site percolation by the following method. One test shall be performed for each treatment measure.
1. Drive a 1 foot diameter pipe 2.5 feet long into the treatment soil until the end is 6 inches above the under drainage (typically 12-inches down).
 2. Wet treatment zone then fill pipe with water to 12 inches above ground elevation.
 3. Pipe should empty 12 inches of water within the following time periods:

<u>Soil Type</u>	<u>Min</u>	<u>Max</u>
Dewatering	1hr 12 min	6hrs
Treatment	1hr 12 min	2hrs 24min
 4. If the in-situ test fails the soil within the treatment measures shall be removed and re-instated.

3.12 DISPOSAL OF EXCESS AND WASTE MATERIALS:

- A. Removal of Excess Excavated Material: Excess material shall be removed by the Contractor off the site in a legal manner.

3.13 FIELD QUALITY CONTROL:

- A. Testing Agency Services: Allow testing agency to inspect and test each subgrade and each fill or backfill layer. Do not proceed until test results for previously completed work verify compliance with requirements.
 - 1. Perform field in-place density tests according to ASTM D1556 (sand cone method), ASTM D2167 (Rubber Balloon Method), or ASTM D2937 (Drive Cylinder Method), as applicable.
 - a. Field in-place density tests may also be performed by the nuclear method according to ASTM D6938 , provided that calibration curves are periodically checked and adjusted to correlate to tests performed using ASTM D1556. With each density calibration check, check the calibration curves furnished with the moisture gauges according to ASTM D6938
 - b. When field in-place density tests are performed using nuclear methods, make calibration checks of both density and moisture gauges at beginning of work on each different type of material encountered, and at intervals as directed by the Architect.
 - 2. Footing Subgrade: At footing subgrades, use a hand probe and consult with the Geotechnical Engineer.
 - 3. Paved and Building Slab Areas; At subgrade and at each compacted fill and backfill layer, perform at least one field in-place density test for every 2,000 square feet or less of paved area or building slab, but in no case fewer than three tests.
 - 4. Foundation Wall Backfill: In each compacted backfill layer, perform at least one field in-place density test for each 100 feet or less of wall length, but no fewer than two tests along a wall face.
 - 5. Trench Backfill: In each compacted initial and final backfill layer, perform at least one filed in-place density test for each 150 feet or less of trench, but not fewer than two tests.
- B. Number and location of test shall be at option of the Geotechnical Engineer.
- C. When testing agency reports that subgrades, fills, or backfills are below specified density, scarify and moisten or aerate, or remove and replace soil to the depth required, re-compact and retest until required density is obtained.
- D. After grading is completed and the testing agency has completed observation of the work, permit no further excavation or filling, except as approved by the District's Representative.

3.14 PROTECTION:

- A. Protect newly graded areas from traffic and erosion. In unpaved areas without landscaping, cover with straw erosion control blanket. Follow manufacturer's recommendations for installation. Provide and place straw wattles or biodegradable fiber logs across the slope at the midpoint and along the downhill edge of site. No soil is to be left uncovered at the completion of construction. Keep free of trash and debris.
- B. Repair and re-establish grades in settled, eroded, and rutted areas to specified tolerances.
- C. Where completed compacted areas are disturbed by subsequent construction operation or adverse weather, scarify surface, reshape, compact to required density and provide other corrective work, including retesting, prior to further construction.

3.15 CLEAN-UP:

- A. Comply with requirements of Section 017400 – CLEANING.

3.16 TERMITICIDE:

- A. Termiticide shall be applied to soils as recommended by the manufacturer. Termiticide shall be applied uniformly at the rate recommended by the manufacturer to all areas beneath and around wood frame structures.

END OF SECTION

SECTION 312300 - STRUCTURAL EXCAVATION AND FILL

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Available Information: “Geotechnical Evaluation and Geologic Hazards Assessment, Las Positas College – STEAM Building, 3000 Campus Hill Drive, Livermore, CA”, dated November 22, 2023, by Ninyo & Moore, is available in accordance with “Information Available to Bidders”.

1.2 SUMMARY

- A. This Section Includes:
 - 1. Excavation for foundations and pits.
 - 2. Backfilling structural excavations as required.
 - 3. Fill over concrete mat foundations.
- B. Related Sections:
 - 1. Division 03 Section “Concrete Formwork” for formwork for footings.
 - 2. Division 31 Section “Earthwork” for mass excavation and/or fill for building pad.

1.3 REFERENCES

- A. ASTM: Standards of the American Society for Testing and Materials (ASTM) apply where cited in this Section.
- B. American Concrete Institute (ACI):
 - 1. ACI 301 - Specifications for Structural Concrete for Buildings, 2010.
 - 2. ACI 229R – Controlled Low Strength Materials, 2013.
- C. California Department of Transportation’s (Caltrans):
 - 1. CSS - Standard Specifications, 2010.

1.4 SITE CONDITIONS

- A. Notify Owner’s Representative when site conditions differ from findings of Geotechnical Investigation Report.

PART 2 – PRODUCTS

2.1 MATERIALS

- A. Concrete: Concrete materials and proportions shall be in accordance with ACI 301 to produce concrete with minimum compressive strength of 2500 psi at 28 days.
- B. Structural Fill: CSS Section 26, Class 2 Aggregate Base rock, 3/4” size.
- C. Controlled Low Strength Material: Machine mixed, self-compacting, low-strength fill consisting of fine aggregate, cementitious materials, entrained air and water. Mix and mixing shall conform to recommendations of ACI 229 to achieve the following properties:

1. Slump: 8 to 10 inches.
 2. Compressive Strength:
 - a. For backfill: Minimum 150 psi to maximum 300 psi at 30 days.
 - b. For fill beneath footings: Minimum 300 psi at 30 days.
 3. Fresh Density: 115 to 145 pounds per cubic.
 4. Subsidence: Minimal; a maximum of 1/16" per foot of thickness.
- D. Pea Gravel: ASTM C 33, Size No 7.
1. Fill material (over mat foundation): Crushed rock of uniform gradation, 100% passing 3/4 inch sieve.

PART 3 – EXECUTION

3.1 PREPARATION

- A. Take measures to prevent surface water from entering excavations.
- B. Notify Geotechnical Engineer at least 48 hours prior to commencing and upon completion of excavations.

3.2 EXCAVATION

- A. Accurately cut foundation excavations to dimensions and elevations shown on Drawings to tolerances of ACI 301.
- B. Where sides are unstable or excavations are not accurately cut, over-excavate to permit placement and removal of formwork.
- C. Shore and brace excavations as required to prevent caving and danger to persons and structures. Comply with applicable safety regulations.
- D. Prepare bottoms of footing excavations to produce conditions acceptable to Owner's Representative, based on professional opinion of Geotechnical Engineer.
 1. The bottoms of excavations shall be firm, undisturbed earth, clean and free from loose material, debris and foreign matter.
 2. Remove or recompact disturbed material.
 3. Remove soft or unstable material to a depth satisfactory to Geotechnical Engineer.
 4. Fill over-depth excavations with concrete, flowable fill, or structural fill compacted to minimum 95% relative compaction.
- E. Maintain footing conditions approved by Geotechnical Engineer until concrete work is complete.
 1. In periods of wet weather, over-excavate footings and place 2-inches minimum concrete mud-slab as soon as practical after completing excavation.
- F. Keep excavations free of water at all times until foundation concrete is cast.
- G. Stockpile or remove excavated material from site in accordance with Division 31 Section "Earthwork".

3.3 BACKFILLING

- A. Place and compact structural fill in accordance with Division 31 Section, "Earthwork".
 1. Use controlled low strength material or pea gravel for backfill against sides of footings and pits, where adequate compaction of structural fill cannot be achieved.
 - a. Controlled low strength material may be used in lieu of structural fill at all locations.

- b. Pea gravel may be used in widths no greater than twelve inches.
 - 1) Pea gravel may not be used where structural fill could otherwise be used.
 - 2) Pea gravel may not be used to back fill utility trenches underneath the building.
- B. Backfill footings after formwork is removed. Do not backfill pits until concrete has cured a minimum of 7 days.

3.4 FILL OVER CONCRETE MAT FOUNDATIONS

- A. Preparation:
 - 1. Verify piping is securely supported against vertical and lateral displacement.
 - 2. Where area is not enclosed prior to placement of fill, make provision for removal of water.
- B. Placement: Fill may be placed to the full specified thickness without compaction.
 - 1. Pipes: Bed pipes in fill up to grade of underside of pipe, taking care not to place material atop pipe. Shovel slice material under and beside the pipe up to the spring line without moving the pipe.
- C. Consolidation: Immediately prior to placement of vapor retarder, consolidate surface with a minimum of 3 passes of a vibratory plate. Achieve specified grade to plus 0 inch to minus 1-1/2 inch tolerance.

3.5 FIELD QUALITY CONTROL

- A. The Geotechnical Engineer will observe footing excavations prior to placement of reinforcement; and again, immediately prior to casting of concrete.
- B. The Geotechnical Engineer will observe the placement of fill and backfill material.

END OF SECTION

SECTION 32 12 33 - PAVING AND SURFACING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes (but is not necessarily limited to):
 - 1. Asphalt Concrete Paving.
 - 2. Portland Cement Concrete Paving.
 - 3. Liquid Asphalt and Asphalt Emulsion.
 - 4. Aggregate Base.
 - 5. Concrete Pavers.
 - 6. Decomposed Granite.
 - 7. Sealants

- B. Related work furnished under other sections but conforming to the provisions of this section:
 - 1. Subgrade preparation.
 - 2. Aggregate Base installation.

- C. Related Sections:
 - 1. Section 31 10 00 – SITE PREPARATION AND DEMOLITION.
 - 2. Section 31 22 00 – EARTHWORK AND GRADING.
 - 3. Section 32 17 23 – PAVEMENT MARKING.

1.2 REFERENCES

- A. American Society for Testing and Materials (ASTM):

 - a. Section 20-10: Decomposed Granite.
 - b. Section 24: Stabilized Soils.
 - c. Section 26: Aggregate Bases.
 - d. Section 37: Bituminous Seals.
 - e. Section 39: Asphalt Concrete.
 - f. Section 40: Concrete Pavement.
 - g. Section 41: Concrete Pavement Repair.
 - h. Section 51: Concrete Structures.
 - i. Section 52: Reinforcement.
 - j. Section 73: Concrete Curbs and Sidewalks.
 - k. Section 88: Geosynthetics.
 - l. Section 90: Portland Cement Concrete.
 - m. Section 92: Asphalts.
 - n. Section 93: Liquid Asphalts.
 - o. Section 94: Asphaltic Emulsions.
 - p. Section 95: Epoxy
 - 2. Traffic Manual.
 - 3. Highway Design.

- D. Institute of Transportation Engineers: Transportation and Traffic Engineering Handbook.

- E. American Concrete Institute Manual of Practice.
- F. Interlocking Concrete Pavement Institute (ICPI).

1.3 SUBMITTALS

- A. Requirements: Refer to Section 01 33 00 – SUBMITTAL PROCEDURES.
- B. Asphalt Concrete Paving:
 - 1. Provide copies of material certificates signed by the material producer and the Contractor, certifying that each material item complies with or exceeds specified requirements.
 - 2. The Contractor shall furnish a certified weight or load slip for each load of material used in the construction of the asphalt concrete pavement.
- C. Concrete Paving: The Contractor shall furnish mill test reports on the cement, reinforcement bars, and aggregates, showing compliance with the respective specifications. The Testing Engineer may make concrete test cylinders and slump tests as deemed necessary to determine compliance with the Specifications.
- D. Liquid Asphalt.
- E. Pavement Reinforcement Fabric.
- F. Tack Coat.
- G. Pavement Reinforcement Mesh.
- H. Structural Geotextile Fabric.
- I. Concrete Pavers.
- J. Slurry Seal.
- K. Joint Sealants.
- L. Backer Rod.
- M. Joint Filler.
- N. Epoxy Crack Filler.
- O. Bonding Epoxy.
- P. Concrete Quality Control Plan. Inclusive of the following:
 - Placing and timing of joints including a location plan for all joints
 - Bar placement, alignment
 - Concrete placement methods
 - Finishing and curing methods and timing.
 - Joint sealants and timing of placement

1.4 PROJECT CONDITIONS

- A. Liquid Asphalt and Asphalt Emulsion:
 - 1. Seal coat and paint binder shall be applied only when the ambient temperature is above 50° Fahrenheit and when temperature has not been below 35° Fahrenheit for 12 hours immediately prior to application.

2. Fog coat, seal coat, and paint binder shall not be applied when base or surfaces are wet or contain excess moisture.
- B. Asphalt Concrete Paving: Asphalt concrete surfaces shall be constructed only when ambient temperature is above 50° Fahrenheit and when base is dry.
- C. Portland Cement Concrete: Concrete shall be placed when the conditions will yield satisfactory results and when the ambient temperature will be above 40°F for 72 hours after placement with no threat of precipitation.
- D. Joint Sealants: Sealants shall be placed per the manufacturers recommendations and when temperature is above 40°F for 2 days after and no threat of precipitation.

PART 2 - PRODUCTS

2.1 PAVING MATERIALS

- A. Aggregate Base: Aggregate base shall conform to Caltrans Class 2 (R value 78 min) aggregate base, 3/4" maximum size, as specified in Section 26 of the Caltrans Standard Specifications.
- B. Asphalt Concrete Paving:
 1. Shall be Type A HMA, conforming to Section 39-2.02B of the Caltrans Standard Specifications.
 2. Asphalt binder to be mixed with aggregate shall be performance-graded asphalt, PG64-10, conforming to Section 92 of the Caltrans Standard Specifications.
 3. Aggregate size shall be as follows:

Total AC Thickness	Min # of AC lifts	Aggregate Grading
3/4 inch - 1 1/2 inch	1	1/2" max
2 inch - 2 1/2 inch	1	1/2" max
3 inch or greater	2	1/2" max for top lift and 3/4" max for initial lifts
 4. If multiple lifts, apply a tack coat before placing a subsequent lift.
 5. Asphaltic emulsion for paint binder, fog coat, and seal coat shall be emulsified asphalt, Type SS-1h, conforming to Section 94 of the Caltrans Standard Specifications
- C. Portland Cement Concrete:
 1. Concrete shall be minor concrete conforming to Section 90-2 of the Caltrans Standard Specifications, except as modified by these specifications.
 2. Concrete Pavement shall contain a minimum of 505 lbs/yard of cementitious material.
 3. Cement shall be a combination of Type II or Type V Portland cement and supplemental cementitious materials conforming to Section 90-1.02B of the Caltrans Standard Specifications.
 4. For minor concrete, the maximum aggregate size must not be larger than 1-1/2 inches or smaller than 3/4 inch, per Section 90-2.02C of the Caltrans Standard Specifications.
 5. Water shall be potable and free of organic matter and injurious amounts of oil, acid, alkali, or other deleterious substances.
 6. Unless otherwise noted on the plans the concrete mix design shall provide a minimum compressive strength of 3,000 psi at 28 days.
 7. Supplementary Cementitious Materials (SCM) shall comply with Section 90-1.02B(3) of the Caltrans Standard Specifications including chemical properties, physical properties, and proportioning.
 8. Reinforcing bars shall be deformed and shall conform to ASTM A615.
 9. Filled joints, unless noted otherwise on the Drawings, shall be 1/4-inch wide, the full depth of the concrete section and conforming to Section 51 of the Caltrans Standard Specifications.
 10. Joint filler shall conform to Section 51 of the Caltrans Standard Specifications for pre-molded expansion joint filler and expanded polystyrene joint filler.
 11. No admixtures will be allowed without prior approval of the Engineer of Record.
- D. Epoxy shall meet the requirements of Section 95 of the Caltrans Standard Specifications.

1. Epoxy used to bond dowels to hardened concrete shall be Type 1, Grade 1, Class B or C per ASTM C881.
 2. For high strength applications epoxy shall be Type IV.
- E. Decomposed Granite:PA
1. Decomposed Granite shall conform to Section 20-5.03D of the Caltrans Standard Specifications.
 2. Soil Sterilant shall be oxadiazone granular preemergent complying with Caltrans Standard Specification Section 20-5.03A(2).
 3. Edging shall comply with Caltrans Standard Specification Section 20-5.02.
 4. Crushed granite rock gradation shall comply with Caltrans Specification Section 20-5.03D(2).
 5. Solidifying Emulsion shall be either a water-based polymer or non-toxic organic powdered binder specifically manufactured to harden decomposed granite. The solidifying emulsion shall not alter the decomposed granite color.
- F. Pavement Reinforcement Fabric: Pavement reinforcement fabric shall meet Caltrans Section 96-1.02J. BP Petromat, or approved equivalent.
- G. Crack Sealant:
1. Crack sealant shall be rubberized hot-pour type and shall meet ASTM D 3405. Husky 1611, or approved equivalent.
 2. Blotting Agent shall be one of: Screened sand, cement, or fly ash.
- H. Tack coat: Tack coat shall meet Caltrans Section 39-2.01B(10).
- I. Pavement reinforcement mesh: Pavement reinforcement mesh for use in overlays shall be Glasgrid Model 8501, or approved equivalent.
- J. Structural geotextile fabric: Structural geotextile fabric shall be Mirafi 500X, or approved equivalent.
- K. Joint Sealant:
1. Dow Corning 890-SL or approved silicone sealant conforming to ASTM D5893, C639, C1183, C679, C792, C66 and C792.
 2. Conform to Caltrans Section 41-5.02B.
- L. Backer Rod
1. Backer Rod shall be expanded, cross-linked, crossed-cell polyethylene foam conforming to ASTM D5249, Type I.
 2. Rod diameter shall be 25% greater than the saw cut joint width

2.2 BITUMINOUS SEALS

- A. Fog Seal: Fog Seal asphaltic emulsion shall conform to Caltrans Section 37-4.02.
- B. Flush Coat: Flush Coat asphaltic emulsion shall conform to Caltrans Section 37-4.03. Sand for the flush coat shall comply with the fine aggregate grading in Caltrans Section 90-1.02C(3), sand must be free of organic material or clays.
- C. Slurry Seal: Slurry seal shall conform to Caltrans Section 37-3.02B, and be Type II unless otherwise specified.
- D. Chip Seal: Chip seal shall conform to Caltrans Section 37-2 for polymer modified asphaltic emulsion seal coat and included screenings per Caltrans Section 37-2.01B.
- E. Crack Sealant: Crack Sealant shall conform to Caltrans Section 37-6.02, Type 2, unless otherwise specified.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Subgrade and Aggregate Base:
 - 1. Prepare subgrade and over excavate per Section 31 22 00 –EARTHWORK AND GRADING.
 - 2. Aggregate base shall be compacted to 95 percent ASTM D1557. Section 26-1.03E of the Caltrans Standard Specifications shall apply.
 - 3. Soil sterilant shall be applied to prepared subgrade or after installation of rock or aggregate base uniformly at the rate recommended by the manufacturer.

- B. Crack Sealing:
 - 1. Before sealing, cracks shall be cleared of dirt, dust, and all other deleterious materials to a depth of 1/4-inch to 1/2-inch.
 - 4. Cracks 1/8-inch in width and greater shall be sealed.
 - 5. Application of crack sealer shall be in accordance with the manufacturer's recommendations unless otherwise directed.

3.2 ASPHALT CONCRETE PAVING

- A. General:
 - 1. Asphalt concrete shall be proportioned, mixed, placed, spread, and compacted in conformance with Section 39 of the Caltrans Standard Specifications.
 - 2. Before placing asphalt concrete, an asphalt emulsion tack coat shall be applied to all vertical surfaces of existing pavement, curbs, gutters, construction joints, and all existing pavement to be surfaced, in conformance with Section 39 of the Caltrans Standard Specifications.
 - 3. Spreading and compacting asphalt concrete shall be performed in accordance with Section 39 of the Caltrans Standard Specifications.
 - 4. Fog seal shall be applied to all finished surfaces of asphalt concrete pavement at a rate of 0.05 gallons per square yard, in accordance with Section 37 of the Caltrans Standard Specifications.
 - 5. After fog seal has been applied, ample time shall be allowed for drying before traffic is allowed on the pavement or paint striping is applied.

3.3 CONCRETE CONSTRUCTION

- A. General:
 - 1. All concrete shall be mixed in accordance with applicable provisions of Section 90 of the Caltrans Standard Specifications.
 - 2. Construction of concrete substructures shall conform to applicable provisions of Section 51 of the Caltrans Standard Specifications. Unless noted otherwise in the Specifications, all exposed surfaces of structure shall have Class 1 surface finish. Finish shall match adjacent existing concrete paving.
 - 3. Schedule of Locations for Concrete Finish Types, unless otherwise specified:
 - a. Slabs or Stairs to receive toppings and fills: Scratched.
 - b. Exposed Stairs Fills: Nonslip.
 - c. Exterior Paved Areas: Light Broomed.
 - d. Formed Surface to receive paint: Smooth Formed.
 - e. Concealed Concrete Surfaces: Rough Formed.
 - 4. Curing shall conform to provision of Caltrans Section 90-1.03B. No pigment shall be used in curing compounds for construction of concrete curbs, gutters, and structures.
 - 5. All work shall be subject to field inspection. No concrete shall be placed until the Program Manager has approved the forms and reinforcement.
 - 6. Expansion joints on curbs and gutters shall be placed 20 feet on centers, adjacent to structures, and at all returns, and shall be filled with joint filler. Control joints shall be formed 10 feet on centers.
 - 7. Concrete shall not be dropped freely where reinforcing bars will cause segregation, nor shall it be dropped freely more than 6 feet. Spouts, elephant trunks, or other approved means shall be used to prevent segregation.

- B. Vehicular Concrete Pavement
 1. All vehicular concrete pavement shall meet the requirements of Section 40 of the Caltrans Standard Specifications.
 2. Contraction Joints shall be a minimum 1/3 of the pavement thickness.
 3. Joints shall be no less than 5 feet apart and no greater than 15 feet apart.
 4. Joints shall make rectangular panels generally square but in no case shall the dimensional ratio exceed 1.5 to 1.
 5. Timing of the joint placement is critical. Sawcut Joints must be placed as soon as the concrete can support the sawing equipment and must be completed prior to the start of volunteer cracking. The contractor is responsible for the timing of joint placement. Typical sawcut joints would be expected to be placed 4-12 hours after concrete placement.

3.4 DECOMPOSED GRANITE

- A. Compact subgrade below decomposed granite to 90% relative compaction.
- B. Sterilize soil with oxadiazon after compaction. Apply at max label rate. Apply sterilant no more than 12" outside of DG area. Soil sterilant application and DG placement shall take place during the same work day.
- C. Aggregate Base shall be spread and compacted as specified under Section 26-1.03D and Section 26-1.03E of the Caltrans Standard Specifications.
- D. Filter Fabric: Surfaces to receive filter fabric shall be free of loose or extraneous material and sharp objects that may damage filter fabric during installation.
 1. Align fabric and place in a wrinkle-free manner.
 2. Overlap adjacent fabric rolls 12 to 18 inches. Rolls shall be spread in same direction: fabric shall be fastened with staples to prevent movement of fabric during placement of decomposed granite.
 3. Filter fabric damaged during placement of decomposed granite shall be repaired or replaced to meet the fabric overlap requirements.
- E. Placement
 1. Decomposed granite shall not be placed during rainy conditions
 2. Solidifying emulsion shall be mixed thoroughly and uniformly throughout the decomposed granite per the manufacturer's instructions.

3.5 BITUMINOUS SEALS

- A. General:
 1. Mixing, spreading and placing shall be in accordance with applicable provisions of Section 37 of the Caltrans Standard Specifications.

3.6 SEALANTS AND BACKER ROD

- A. General: Where indicated on the plans and/or specifications, Contractor shall seal joints with a sealant and backer rod.
 1. Width and depth of joints shall meet project requirements and accommodate sealant and backer rod in conformance with Manufactures requirements.
 2. Placements and shall conform to Manufactures requirements.

3.7 FIELD QUALITY CONTROL

- A. Asphalt Concrete Paving:
 1. Contractor shall perform a flood test in the presence of the engineer and/or District's Representative. Location of ponding greater than 1/8" in depth may impact proper drainage and shall be marked and remedied by the contractor.

2. The specified thickness of the finished pavement shown on the plans and specifications shall be the minimum acceptable.
3. Conforms shall form a smooth, pond-free transition between existing and new pavement.
4. Depressions in paving between high spots are not to exceed 1/8-inch when measured below a 10-foot long straight-edge placed anywhere on surface in any direction.
5. The finished asphalt pavement shall have positive drainage without ponding.

3.8 CLEANUP

- A. General:
1. Surplus material remaining upon completion of paving operations shall become the property of the Contractor, to be removed from the work site and disposed of in a lawful manner.
 2. Surfaces shall be left in a clean, neat, and workmanlike condition, and all construction waste, rubbish, and debris shall be removed from the work site and disposed of in a lawful manner.

END OF SECTION

SECTION 321313 - CONCRETE PAVING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes concrete paving[.][**including the following:**]
1. Driveways.
 2. Roadways.
 3. Parking lots.
 4. Curbs and gutters.
 5. Walks.
- B. Related Documents:
1. The basis for designing concrete mixtures and demonstrating compliance with carbon budget targets shall be in accordance with:
 - a. National Ready Mixed Concrete Association (NRMCA) Cradle-to-Gate Life Cycle Assessment of Ready-Mixed Concrete Manufactured by NRMCA Members – Version 3 (or later).
 - b. National Ready Mixed Concrete Association, NRMCA Member Industry Average EPD for Ready Mixed Concrete – Version 3 (or later).
- C. Embodied Carbon Goals:
1. This project has a goal of reducing the embodied carbon footprint relative to a benchmark established the NRCMA Cradle-to-Gate Life Cycle Assessment Version 3 (or later). The target maximum Global Warming Potential (GWP) and target for maximum portland cement content is provided in PART 2 PRODUCTS. The target carbon footprint reduction for concrete is a weighted average by volume. It shall be permitted to propose the use of innovative products and manufacturing processes for approval by the Engineer of Record. Proposed alternatives shall meet all performance criteria for strength, durability, and constructability, and achieve the required reduction in carbon footprint.
 2. CO2 mineralized concrete is permitted where available, pending concrete performance criteria is met.

1.2 DEFINITIONS

- A. Cementitious Materials: Portland cement alone or in combination with one or more of blended hydraulic cement, fly ash, slag cement, and other pozzolans.
- B. W/C Ratio: The ratio by weight of water to cementitious materials.
- C. Embodied Carbon Footprint: embodied carbon is the carbon dioxide equivalent (CO₂e) footprint of a building or infrastructure project before it becomes operational. Embodied carbon is distinct from operational carbon – data the carbon that comes from energy, heat, lighting, etc. Embodied carbon is generally expressed as Global Warming Potential. Typically, the embodied carbon is the initial embodied carbon which only accounts for the cradle to gate impacts.
- D. Global Warming Potential: Global warming potential (GWP) is the heat absorbed by any greenhouse gas in the atmosphere, as a multiple of the heat that would be absorbed by the same mass of carbon dioxide. GWP is 1 for CO₂. For other gases it depends on the gas and the time frame. GWP for concrete is expressed in kg of CO₂e per unit of concrete (cubic yard or cubic meter).

- E. Environmental Product Declaration: An Environmental Product Declaration (EPD) quantifies environmental information on the life cycle of a product to enable comparisons between products fulfilling the same function. EPDs are conducted in accordance with a Product Category Rule for the specific product being evaluated. (International Organization for Standardization 14025 as a Type III declaration).
- F. Product Category Rule: Product Category Rules (PCR) are a set of rules, requirements, and guidelines for developing Environmental Product Declarations (EPD) for one or more product categories. The PCR for concrete is published by NSF International.
- G. Life Cycle Assessment: Life cycle assessment (LCA) is a methodology for assessing environmental impacts associated with all the stages of the life cycle of a commercial product, process, or service.
- H. Carbon Dioxide Mineralization: Active carbonation treatment of concrete during mixing such that the carbon dioxide (CO₂) that is injected during mixing is mineralized (I.E.chemically converted into a mineral) within the concrete. The concrete may undergo mix optimization whereby the strength enhancement property of the mineralized CO₂ is utilized to adjust cementitious content, pending that the optimized concrete mix meets concrete performance requirements as outlined.
- I. Carbonization Treatment: Active introduction of CO₂ into the concrete pore fluid which reacts with calcium from calcium hydroxide and calcium silicate hydrate to form calcite (CaCO₃).

1.3 PREINSTALLATION MEETINGS

- A. Preinstallation Conference: Conduct conference at Project site.
 - 1. Review methods and procedures related to concrete paving, including but not limited to, the following:
 - a. Concrete mixture design.
 - b. Quality control of concrete materials and concrete paving construction practices.
 - c. Curing procedures.
 - d. Cold and hot weather concreting procedures.
 - e. Global warming potential (GWP) limits.
 - 2. Require representatives of each entity directly concerned with concrete paving to attend, including the following:
 - a. Contractor's superintendent.
 - b. Independent testing agency responsible for concrete design mixtures.
 - c. Ready-mix concrete manufacturer.
 - d. Concrete paving Subcontractor.
 - e. Manufacturer's representative of stamped concrete paving system used for stamped detectable warnings.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.
- B. Sustainable Design Submittals:
 - 1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
- C. Embodied Carbon Footprint Submittals:
 - 1. Plant specific Environmental Product Declaration (EPD) for each concrete mixture proposed for the project accompanying each concrete mixture submittal.

- a. It shall be permitted to substitute plant-specific EPDs with those listed in NRMCA Member Industry Average EPD for Ready Mixed Concrete if the proposed mixtures are similar to those listed and the concrete producer participated in providing data for the NRMCA Cradle-to-Gate Life Cycle Assessment of Ready-Mixed Concrete.
 2. Plant specific Environmental Product Declaration (EPD) for each steel and fiber reinforcement product proposed for the project.
 3. A calculation showing that the Global Warming Potential (GWP) of all the concrete and reinforcing materials supplied for the project considered as a weighted average by volume shall be lower than the GWP target set in Section 2.
- D. Shop Drawings: Indicate pavement markings, lane separations, and defined parking spaces. Indicate, with international symbol of accessibility, spaces allocated for people with disabilities.
- E. Other Action Submittals:
1. Design Mixtures: For each concrete paving mixture. Include alternate design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.

1.5 INFORMATIONAL SUBMITTALS

- A. Material Certificates: For the following, from manufacturer:
1. Cementitious materials.
 2. Steel reinforcement and reinforcement accessories.
 3. Fiber reinforcement.
 4. Admixtures.
 5. Curing compounds.
 6. Applied finish materials.
 7. Bonding agent or epoxy adhesive.
 8. Joint fillers.
- B. Material Test Reports: For each of the following:
1. Aggregates: [**Include service-record data indicating absence of deleterious expansion of concrete due to alkali-aggregate reactivity.**]
- C. Field quality-control reports.
- D. Product Test Reports and Certificates: For each of the following, signed by manufacturers:
1. Carbon dioxide mineralization: Provide concrete producers certificate verifying mineralization of carbon dioxide. Include quantity, location, and supplier of injected CO2.

1.6 QUALITY ASSURANCE

- A. Stamped Detectable Warning Installer Qualifications: An employer of workers trained and approved by manufacturer of stamped concrete paving systems.
- B. Ready-Mix-Concrete Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C94/C94M requirements for production facilities and equipment.
- C. Documentation that the concrete supplier participated in supplying data to the NRMCA Cradle-to-Gate Life Cycle Assessment of Ready-Mixed Concrete.
1. Manufacturer certified according to NRMCA's "Certification of Ready Mixed Concrete Production Facilities" (Quality Control Manual - Section 3, "Plant Certification Checklist").

- D. Testing Agency Qualifications: Qualified according to ASTM C1077 and ASTM E329 for testing indicated.
 - 1. Personnel conducting field tests must be qualified as ACI Concrete Field Testing Technician, Grade 1, according to ACI CP-1 or an equivalent certification program.

1.7 PRECONSTRUCTION TESTING

- A. Preconstruction Testing Service: Engage a qualified independent testing agency to perform preconstruction testing on concrete paving mixtures.

1.8 FIELD CONDITIONS

- A. Traffic Control: Maintain access for vehicular and pedestrian traffic as required for other construction activities.
- B. Cold-Weather Concrete Placement: Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing, or low temperatures. Comply with ACI 306.1 and the following:
 - 1. When air temperature has fallen to or is expected to fall below 40 deg F, uniformly heat water and aggregates before mixing to obtain a concrete mixture temperature of not less than 50 deg F and not more than 80 deg F at point of placement.
 - 2. Do not use frozen materials or materials containing ice or snow.
 - 3. Do not use calcium chloride, salt, or other materials containing antifreeze agents or chemical accelerators unless otherwise specified and approved in design mixtures.
- C. Hot-Weather Concrete Placement: Comply with ACI 301 and as follows when hot-weather conditions exist:
 - 1. Cool ingredients before mixing to maintain concrete temperature below 90 deg F at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated in total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.
 - 2. Cover steel reinforcement with water-soaked burlap, so steel temperature will not exceed ambient air temperature immediately before embedding in concrete.
 - 3. Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. Keep subgrade moisture uniform without standing water, soft spots, or dry areas.

PART 2 - PRODUCTS

2.1 CONCRETE, GENERAL

- A. ACI Publications: Comply with ACI 301 unless otherwise indicated.

2.2 STEEL REINFORCEMENT

- A. Recycled Content of Steel Products: Recycled content not less than 90 percent, Provide documentation indicating postconsumer and preconsumer recycled content.
- B. Plain-Steel Welded-Wire Reinforcement: ASTM A1064/A1064M, fabricated from as-drawn steel wire into flat sheets.
- C. Epoxy-Coated Welded-Wire Reinforcement: ASTM A884/A884M, Class A, plain steel.
- D. Reinforcing Bars: ASTM A615/A615M, Grade 60; deformed.
- E. Epoxy-Coated Reinforcing Bars: ASTM A775/A775M or ASTM A934/A934M; with ASTM A615/A615M, Grade 60 deformed bars.

- F. Plain-Steel Wire: ASTM A1064/A1064M, as drawn.
- G. Epoxy-Coated-Steel Wire: ASTM A884/A884M, Class A; coated, plain.
- H. Joint Dowel Bars: ASTM A615/A615M, Grade 60 plain-steel bars. Cut bars true to length with ends square and free of burrs.
- I. Epoxy-Coated, Joint Dowel Bars: ASTM A775/A775M; with ASTM A615/A615M, Grade 60 plain-steel bars.
- J. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars, welded-wire reinforcement, and dowels in place. Manufacture bar supports according to CRSI's "Manual of Standard Practice" from steel wire, plastic, or precast concrete of greater compressive strength than concrete specified, and as follows:
 - 1. Equip wire bar supports with sand plates or horizontal runners where base material will not support chair legs.
 - 2. For epoxy-coated reinforcement, use epoxy-coated or other dielectric-polymer-coated wire bar supports.
- K. Epoxy Repair Coating: Liquid, two-part, epoxy repair coating, compatible with epoxy coating on reinforcement.

2.3 CONCRETE MATERIALS

- A. Cementitious Materials: Materials conforming to the following are permitted:
 - 1. Portland Cement: ASTM C150/C150M, gray portland cement Type I/II.
 - 2. Blended Hydraulic Cement: ASTM C595/C595M, Type IS, portland blast-furnace slag Type IP, portland-pozzolan Type IL, Portland-limestone Type IT, ternary blended cement, excluding:
 - a. Type IS (70) and Type IT (70).
 - 3. Hydraulic cement: ASTM C1157/C1157M.
 - 4. Fly ash or natural pozzolan: ASTM C618, Class C or Class F.
 - 5. Slag cement: ASTM C989/C989M, Grade 100 or 120.
 - 6. Silica fume: ASTM C1240/C1240M.
 - 7. Ground glass pozzolan: ASTM C1866/C1866M.
- B. Normal-Weight Aggregates: ASTM C33/C33M, Class 4S, uniformly graded. Provide aggregates from a single source with documented service-record data of at least 10 years' satisfactory service in similar paving applications and service conditions using similar aggregates and cementitious materials.
 - 1. Maximum Coarse-Aggregate Size: 3/4 inch nominal.
 - 2. Fine Aggregate: Free of materials with deleterious reactivity to alkali in cement.
- C. Water: Complying with ASTM C1602.
- D. Air-Entraining Admixture: ASTM C260/C260M.
- E. Chemical Admixtures: Admixtures certified by manufacturer to be compatible with other admixtures and to contain not more than 0.1 percent water-soluble chloride ions by mass of cementitious material.

1. Water-Reducing Admixture: ASTM C494/C494M, Type A.
2. Retarding Admixture: ASTM C494/C494M, Type B.
3. Water-Reducing and Retarding Admixture: ASTM C494/C494M, Type D.
4. High-Range, Water-Reducing Admixture: ASTM C494/C494M, Type F.
5. High-Range, Water-Reducing and Retarding Admixture: ASTM C494/C494M, Type G.
6. Plasticizing and Retarding Admixture: ASTM C1017/C1017M, Type II.

- F. Carbon Dioxide Mineralization: ASTM C494 Type S. Carbon dioxide in the mixture must be post-industrial.

2.4 CURING MATERIALS

- A. Absorptive Cover: AASHTO M 182, Class 3, burlap cloth made from jute or kenaf, weighing approximately 9 oz./sq. yd. dry.
- B. Moisture-Retaining Cover: ASTM C171, polyethylene film or white burlap-polyethylene sheet.
- C. Water: Potable.
- D. Evaporation Retarder: Waterborne, monomolecular, film forming, manufactured for application to fresh concrete.
- E. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C309, Type 1, Class B, dissipating.

2.5 RELATED MATERIALS

- A. Joint Fillers: ASTM D1752, cork or self-expanding cork or ASTM D8139, semirigid, closed-cell polypropylene foam in preformed strips.
- B. Slip-Resistive Aggregate Finish: Factory-graded, packaged, rustproof, nonglazing, abrasive aggregate of fused aluminum-oxide granules or crushed emery aggregate containing not less than 50 percent aluminum oxide and not less than 20 percent ferric oxide; unaffected by freezing, moisture, and cleaning materials.
- C. Bonding Agent: ASTM C1059/C1059M, Type II, non-redispersible, acrylic emulsion or styrene butadiene.
- D. Epoxy-Bonding Adhesive: ASTM C881/C881M, two-component epoxy resin capable of humid curing and bonding to damp surfaces; of class suitable for application temperature, of grade complying with requirements, and of the following types:
1. Types IV and V, load bearing, for bonding hardened or freshly mixed concrete to hardened concrete.
- E. Chemical Surface Retarder: Water-soluble, liquid, set retarder with color dye, for horizontal concrete surface application, capable of temporarily delaying final hardening of concrete to a depth of 1/8 to 1/4 inch.

2.6 CONCRETE MIXTURES

- A. Prepare design mixtures, proportioned according to ACI 301, for each type and strength of normal-weight concrete, and as determined by either laboratory trial mixtures or field experience.
1. Use a qualified independent testing agency for preparing and reporting proposed concrete design mixtures for the trial batch method.
 2. When automatic machine placement is used, determine design mixtures and obtain laboratory test results that comply with or exceed requirements.
- B. Drying shrinkage limit is percentage in change in length after 28 days of drying when tested as per ASTM C157 with 3 inches x 3 inches x 11 inches specimen moist cured 7 days prior to drying.

- C. Add air-entraining admixture at manufacturer's prescribed rate to result in normal-weight concrete at point of placement having an air content as follows:
 - 1. Air Content, 3/4-inch Nominal Maximum Aggregate Size: 6 percent plus or minus 1-1/2 percent.
- D. Limit water-soluble, chloride-ion content in hardened concrete to 0.15 percent by weight of cement.
- E. Chemical Admixtures: Use admixtures according to manufacturer's written instructions.
 - 1. Use water-reducing admixture high-range, water-reducing admixture high-range, water-reducing and retarding admixture plasticizing and retarding admixture in concrete as required for placement and workability.
 - 2. Use water-reducing and retarding admixture when required by high temperatures, low humidity, or other adverse placement conditions.
- F. Concrete Mixtures: Normal-weight concrete.
 - 1. Compressive Strength (56 Days): 4000 psi.
 - 2. Maximum W/C Ratio at Point of Placement: 0.45.
 - 3. Slump Limit: 4 inches, plus or minus 1 inch.
 - 4. Shrinkage Limit: 0.04 percent.
- G. Global Warming Potential (GWP) or portland cement content shall be [20%][30%][40%] lower than the baselines established below.
 - 1. Baselines for 4000 psi
 - a. GWP: 236 kg CO₂e/cubic yard
 - b. Cement Content: 475 pounds / cubic yard
 - 2. Ready-Mixed Concrete: Measure, batch, and mix concrete materials and concrete according to ASTM C94/C94M and ASTM C1116/C1116M. Furnish batch certificates for each batch discharged and used in the Work.
 - 3. When air temperature is between 85 and 90 deg F, reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F, reduce mixing and delivery time to 60 minutes.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine exposed subgrades and subbase surfaces for compliance with requirements for dimensional, grading, and elevation tolerances.
- B. Proof-roll prepared subbase surface below concrete paving to identify soft pockets and areas of excess yielding.
 - 1. Completely proof-roll subbase in one direction and repeat in perpendicular direction. Limit vehicle speed to 3 mph.
 - 2. Proof-roll with a pneumatic-tired and loaded, 10-wheel, tandem-axle dump truck weighing not less than 15 tons.
 - 3. Correct subbase with soft spots and areas of pumping or rutting exceeding depth of 1/2 inch according to requirements in Section 312000 "Earth Moving."
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Remove loose material from compacted subbase surface immediately before placing concrete.

3.3 EDGE FORMS AND SCREED CONSTRUCTION

- A. Set, brace, and secure edge forms, bulkheads, and intermediate screed guides to required lines, grades, and elevations. Install forms to allow continuous progress of work and so forms can remain in place at least 24 hours after concrete placement.
- B. Clean forms after each use and coat with form-release agent to ensure separation from concrete without damage.

3.4 INSTALLATION OF STEEL REINFORCEMENT

- A. General: Comply with CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.
- B. Clean reinforcement of loose rust and mill scale, earth, ice, or other bond-reducing materials.
- C. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during concrete placement. Maintain minimum cover to reinforcement.
- D. Install welded-wire reinforcement in lengths as long as practicable. Lap adjoining pieces at least one full mesh, and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.
- E. Epoxy-Coated Reinforcement: Use epoxy-coated steel wire ties to fasten epoxy-coated reinforcement. Repair cut and damaged epoxy coatings with epoxy repair coating according to ASTM D3963/D3963M.
- F. Install fabricated bar mats in lengths as long as practicable. Handle units to keep them flat and free of distortions. Straighten bends, kinks, and other irregularities, or replace units as required before placement. Set mats for a minimum 2-inch overlap of adjacent mats.

3.5 JOINTS

- A. General: Form construction, isolation, and contraction joints and tool edges true to line, with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline unless otherwise indicated.
 - 1. When joining existing paving, place transverse joints to align with previously placed joints unless otherwise indicated.
- B. Construction Joints: Set construction joints at side and end terminations of paving and at locations where paving operations are stopped for more than one-half hour unless paving terminates at isolation joints.
 - 1. Continue steel reinforcement across construction joints unless otherwise indicated. Do not continue reinforcement through sides of paving strips unless otherwise indicated.
 - 2. Provide tie bars at sides of paving strips where indicated.
 - 3. Butt Joints: Use **[bonding agent] [epoxy-bonding adhesive]** at joint locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
 - 4. Keyed Joints: Provide preformed keyway-section forms or bulkhead forms with keys unless otherwise indicated. Embed keys at least 1-1/2 inches into concrete.
 - 5. Doweled Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or coat with asphalt one-half of dowel length to prevent concrete bonding to one side of joint.
- C. Isolation Joints: Form isolation joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, other fixed objects, and where indicated.
 - 1. Locate expansion joints at intervals of [50 feet] unless otherwise indicated.
 - 2. Extend joint fillers full width and depth of joint.

3. Terminate joint filler not less than 1/2 inch or more than 1 inch below finished surface if joint sealant is indicated.
 4. Place top of joint filler flush with finished concrete surface if joint sealant is not indicated.
 5. Furnish joint fillers in one-piece lengths. Where more than one length is required, lace or clip joint-filler sections together.
 6. During concrete placement, protect top edge of joint filler with metal, plastic, or other temporary preformed cap. Remove protective cap after concrete has been placed on both sides of joint.
- D. Contraction Joints: Form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at least one-fourth of the concrete thickness, as follows[, **to match jointing of existing adjacent concrete paving**]:
1. Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint with grooving tool to a [1/4-inch] [3/8-inch] radius. Repeat grooving of contraction joints after applying surface finishes. [**Eliminate grooving-tool marks on concrete surfaces.**]
 - a. Tolerance: Ensure that grooved joints are within [3 inches] either way from centers of dowels.
 2. Sawed Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch- wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before developing random contraction cracks.
 - a. Tolerance: Ensure that sawed joints are within [3 inches] either way from centers of dowels.
 3. Doweled Contraction Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or coat with asphalt one-half of dowel length to prevent concrete bonding to one side of joint.
- E. Edging: After initial floating, tool edges of paving, gutters, curbs, and joints in concrete with an edging tool to a [1/4-inch] [3/8-inch] radius. Repeat tooling of edges after applying surface finishes. [**Eliminate edging-tool marks on concrete surfaces.**]

3.6 CONCRETE PLACEMENT

- A. Before placing concrete, inspect and complete formwork installation, steel reinforcement, and items to be embedded or cast-in.
- B. Remove snow, ice, or frost from subbase surface and steel reinforcement before placing concrete. Do not place concrete on frozen surfaces.
- C. Moisten subbase to provide a uniform dampened condition at time concrete is placed. Do not place concrete around manholes or other structures until they are at required finish elevation and alignment.
- D. Comply with ACI 301 requirements for measuring, mixing, transporting, and placing concrete.
- E. Do not add water to concrete during delivery or at Project site. Do not add water to fresh concrete after testing.
- F. Deposit and spread concrete in a continuous operation between transverse joints. Do not push or drag concrete into place or use vibrators to move concrete into place.
- G. Consolidate concrete according to ACI 301 by mechanical vibrating equipment supplemented by hand spading, rodding, or tamping.
 1. Consolidate concrete along face of forms and adjacent to transverse joints with an internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Use only square-faced shovels for hand spreading and consolidation. Consolidate with care to prevent dislocating reinforcement dowels and joint devices.
- H. Screed paving surface with a straightedge and strike off.

- I. Commence initial floating using bull floats or darbies to impart an open-textured and uniform surface plane before excess moisture or bleedwater appears on the surface. Do not further disturb concrete surfaces before beginning finishing operations or spreading surface treatments.
- J. Curbs and Gutters: Use design mixture for automatic machine placement. Produce curbs and gutters to required cross section, lines, grades, finish, and jointing.
- K. Slip-Form Paving: Use design mixture for automatic machine placement. Produce paving to required thickness, lines, grades, finish, and jointing.
 - 1. Compact subbase and prepare subgrade of sufficient width to prevent displacement of slip-form paving machine during operations.

3.7 FLOAT FINISHING

- A. General: Do not add water to concrete surfaces during finishing operations.
- B. Float Finish: Begin the second floating operation when bleedwater sheen has disappeared and concrete surface has stiffened sufficiently to permit operations. Float surface with power-driven floats or by hand floating if area is small or inaccessible to power units. Finish surfaces to true planes. Cut down high spots and fill low spots. Refloat surface immediately to uniform granular texture.
 - 1. Burlap Finish: Drag a seamless strip of damp burlap across float-finished concrete, perpendicular to line of traffic, to provide a uniform, gritty texture.
 - 2. Medium-to-Fine-Textured Broom Finish: Draw a soft-bristle broom across float-finished concrete surface, perpendicular to line of traffic, to provide a uniform, fine-line texture.
 - 3. Medium-to-Coarse-Textured Broom Finish: Provide a coarse finish by striating float-finished concrete surface 1/16 to 1/8 inch deep with a stiff-bristled broom, perpendicular to line of traffic.

3.8 SPECIAL FINISHES

- A. Monolithic Exposed-Aggregate Finish: Expose coarse aggregate in paving surface as follows:
 - 1. Immediately after float finishing, spray-apply chemical surface retarder to paving according to manufacturer's written instructions.
 - 2. Cover paving surface with plastic sheeting, sealing laps with tape, and remove when ready to continue finishing operations.
 - 3. Without dislodging aggregate, remove mortar concealing the aggregate by lightly brushing surface with a stiff, nylon-bristle broom. Do not expose more than one-third of the average diameter of the aggregate and not more than one-half of the diameter of the smallest aggregate.
 - 4. Fine-spray surface with water and brush. Repeat cycle of water flushing and brushing until cement film is removed from aggregate surfaces to depth required.
- B. Seeded Exposed-Aggregate Finish: Immediately after initial floating, spread a single layer of aggregate uniformly on paving surface. Tamp aggregate into plastic concrete and float finish to entirely embed aggregate with mortar cover of 1/16 inch.
 - 1. Spray-apply chemical surface retarder to paving according to manufacturer's written instructions.
 - 2. Cover paving surface with plastic sheeting, sealing laps with tape, and remove sheeting when ready to continue finishing operations.
 - 3. Without dislodging aggregate, remove mortar concealing the aggregate by lightly brushing surface with a stiff, nylon-bristle broom. Do not expose more than one-third of the average diameter of the aggregate and not more than one-half of the diameter of the smallest aggregate.
 - 4. Fine-spray surface with water and brush. Repeat cycle of water flushing and brushing until cement film is removed from aggregate surfaces to depth required.
- C. Slip-Resistive Aggregate Finish: Before final floating, spread slip-resistive aggregate finish on paving surface according to manufacturer's written instructions and as follows:

1. Uniformly spread [25 lb/100 sq. ft.] [40 lb/100 sq. ft.] [60 lb/100 sq. ft.] of dampened, slip-resistant aggregate over paving surface in two applications. Tamp aggregate flush with surface using a steel trowel, but do not force below surface.
2. Uniformly distribute approximately two-thirds of slip-resistant aggregate over paving surface with mechanical spreader, allow to absorb moisture, and embed by power floating. Follow power floating with a second slip-resistant aggregate application, uniformly distributing remainder of material at right angles to first application to ensure uniform coverage, and embed by power floating.
3. Cure concrete with curing compound recommended by slip-resistant aggregate manufacturer. Apply curing compound immediately after final finishing.
4. After curing, lightly work surface with a steel-wire brush or abrasive stone and water to expose nonslip aggregate.

3.9 INSTALLATION OF DETECTABLE WARNINGS

- A. Blockouts: Form blockouts in concrete for installation of detectable paving units specified in Section 321726 "Tactile Warning Surfacing."
 1. Tolerance for Opening Size: **[Plus 1/4 inch, no minus]**.
- B. Cast-in-Place Detectable Warning Tiles: Form blockouts in concrete for installation of tiles specified in Section 321726 "Tactile Warning Surfacing." Screed surface of concrete where tiles are to be installed to elevation, so that edges of installed tiles will be flush with surrounding concrete paving. Embed tiles in fresh concrete to comply with Section 321726 "Tactile Warning Surfacing" immediately after screeding concrete surface.
- C. Stamped Detectable Warnings: Install stamped detectable warnings as part of a continuous concrete paving placement and according to stamp-mat manufacturer's written instructions.
 1. Before using stamp mats, verify that the vent holes are unobstructed.
 2. Apply liquid release agent to the concrete surface and the stamp mat.
 3. Stamping: **[While initially finished concrete is plastic] [After application and final floating of pigmented mineral dry-shake hardener]**, accurately align and place stamp mats in sequence. Uniformly load, gently vibrate, and press mats into concrete to produce imprint pattern on concrete surface. Load and tamp mats directly perpendicular to the stamp-mat surface to prevent distortion in shape of domes. Press and tamp until mortar begins to come through all of the vent holes. Gently remove stamp mats.
 4. Trimming: After **[24]** hours, cut off the tips of mortar formed by the vent holes.
 5. Remove residual release agent according to manufacturer's written instructions, but no fewer than three days after stamping concrete. High-pressure-wash surface and joint patterns, taking care not to damage stamped concrete. Control, collect, and legally dispose of runoff.

3.10 CONCRETE PROTECTION AND CURING

- A. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures.
- B. Comply with ACI 306.1 for cold-weather protection.
- C. Evaporation Retarder: Apply evaporation retarder to concrete surfaces if hot, dry, or windy conditions cause moisture loss approaching 0.2 lb/sq. ft. x h before and during finishing operations. Apply according to manufacturer's written instructions after placing, screeding, and bull floating or darbying concrete but before float finishing.
- D. Begin curing after finishing concrete but not before free water has disappeared from concrete surface.
- E. Curing Methods: Cure concrete by moisture curing moisture-retaining-cover curing curing compound as follows:
 1. Moisture Curing: Keep surfaces continuously moist for not less than seven days with the following materials:

- a. Water.
 - b. Continuous water-fog spray.
 - c. Absorptive cover, water saturated and kept continuously wet. Cover concrete surfaces and edges with 12-inch lap over adjacent absorptive covers.
2. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover, placed in widest practicable width, with sides and ends lapped at least 12 inches, and sealed by waterproof tape or adhesive. Immediately repair any holes or tears occurring during installation or curing period, using cover material and waterproof tape.
 3. Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating, and repair damage during curing period.

3.11 PAVING TOLERANCES

- A. Comply with tolerances in ACI 117 and as follows:
 1. Elevation: 3/4 inch.
 2. Thickness: Plus 3/8 inch, minus 1/4 inch.
 3. Surface: Gap below 10-feet- long; unleveled straightedge not to exceed 1/2 inch.
 4. Alignment of Tie-Bar End Relative to Line Perpendicular to Paving Edge: 1/2 inch per 12 inches of tie bar.
 5. Lateral Alignment and Spacing of Dowels: 1 inch.
 6. Vertical Alignment of Dowels: 1/4 inch.
 7. Alignment of Dowel-Bar End Relative to Line Perpendicular to Paving Edge: 1/4 inch per 12 inches of dowel.
 8. Joint Spacing: 3 inches.
 9. Contraction Joint Depth: Plus 1/4 inch, no minus.
 10. Joint Width: Plus 1/8 inch, no minus.

3.12 FIELD QUALITY CONTROL

- A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.
- B. Testing Services: Testing and inspecting of composite samples of fresh concrete obtained according to ASTM C172/C172M will be performed according to the following requirements:
 1. Testing Frequency: Obtain at least one composite sample for each [100 cu. yd.] [5000 sq. ft.] or fraction thereof of each concrete mixture placed each day.
 - a. When frequency of testing will provide fewer than five compressive-strength tests for each concrete mixture, testing to be conducted from at least five randomly selected batches or from each batch if fewer than five are used.
 2. Slump: ASTM C143/C143M; one test at point of placement for each composite sample, but not less than one test for each day's pour of each concrete mixture. Perform additional tests when concrete consistency appears to change.
 3. Air Content: ASTM C231/C231M, pressure method; one test for each composite sample, but not less than one test for each day's pour of each concrete mixture.
 4. Concrete Temperature: ASTM C1064/C1064M; one test hourly when air temperature is 40 deg F and below and when it is 80 deg F and above, and one test for each composite sample.
 5. Compression Test Specimens: ASTM C31/C31M; cast and laboratory cure one set of three standard cylinder specimens for each composite sample.
 6. Compressive-Strength Tests: ASTM C39/C39M; test one specimen at seven days and two specimens at 28 days.
 - a. A compressive-strength test to be the average compressive strength from two specimens obtained from same composite sample and tested at 28 days.

- C. Strength of each concrete mixture will be satisfactory if average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength and no compressive-strength test value falls below specified compressive strength by more than 500 psi.
- D. Test results to be reported in writing to Architect, concrete manufacturer, and Contractor within 48 hours of testing. Reports of compressive-strength tests to contain Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, location of concrete batch in Work, design compressive strength at 28 days, concrete mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests.
- E. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted by Architect but will not be used as sole basis for approval or rejection of concrete.
- F. Additional Tests: Testing and inspecting agency will make additional tests of concrete when test results indicate that slump, air entrainment, compressive strengths, or other requirements have not been met, as directed by Architect.
- G. Concrete paving will be considered defective if it does not pass tests and inspections.
- H. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
- I. Prepare test and inspection reports.

3.13 REPAIR AND PROTECTION

- A. Remove and replace concrete paving that is broken, damaged, or defective or that does not comply with requirements in this Section. Remove work in complete sections from joint to joint unless otherwise approved by Architect.
- B. Drill test cores, where directed by Architect, when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory paving areas with portland cement concrete bonded to paving with epoxy adhesive.
- C. Protect concrete paving from damage. Exclude traffic from paving for at least 14 days after placement. When construction traffic is permitted, maintain paving as clean as possible by removing surface stains and spillage of materials as they occur.
- D. Maintain concrete paving free of stains, discoloration, dirt, and other foreign material. Sweep paving not more than two days before date scheduled for Substantial Completion inspections.

END OF SECTION 321313

SECTION 324020 - LANDSCAPE METALWORK

PART 1 - GENERAL

1.1 DESCRIPTION

- A. Provide all labor, materials and equipment as required for complete, finished installation of metalwork as shown on the drawings and specified including the following items:
 - 1. Railing for non-architectural site ramps and stairs
 - 2. Miscellaneous landscape metal
- B. Metal fabrication includes plates, bars, strips, tubes, pipes and castings made from iron and steel that are not specifically listed herein.

1.2 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 321313 "Site Concrete"
- B. Section 329000 "Planting"

1.3 REFERENCES AND STANDARDS

- A. "Code for Arc and Gas Welding in Building Construction" of American Welding Society, AWS D1.1, latest edition, with current supplements and addenda, is hereby made a part of this Section and miscellaneous metalwork shall conform to the applicable requirements therein, except as otherwise specified herein or shown on the drawings. Nothing contained herein shall be construed as permitting work that is contrary to code requirements or governing rules and regulations.
- B. All work shall conform to the American Institute of Steel Construction Specifications for design, erection and fabrication, and acceptable standards of good practice. Finished members shall be true to line and free from twists and bends.
- C. SSPC "Steel Structures Painting Manual, Volume 2, Systems and Specifications".
- D. National Association of Architectural Metal Manufacturers (NAAMM): Metal Finishes Manual
- E. SSPC-SP1 Solvent Clean
- F. SSPC-SP2 Hand Tool Clean
- G. SSPC-SP3 Power Tool Clean
- H. SSPC-Surface Preparation Commentary for Metal Surfaces
- I. SSPC-SP6/NACE No. 3 Commercial Blast Clean
- J. SSPC-SP11 Power Tool Clean to Bare Metal
- K. SSPC-SP16 Brush-Off Blast Cleaning of coated and Uncoated Galvanized Steel, Stainless Steels and Non-Ferrous Metals

1.4 SUBMITTALS, per Section 013300

- A. Product Data: Furnish manufacturer's literature including paint, grout and recommendations for cleaning.

- B. Shop Drawings: Shall show dimensions, sizes, thicknesses, gauges, finishes, joining attachments and relationship of work to adjoining construction. Where items must fit and coordinate with finished surfaces and/or constructed spaces, take measurements at site and not from drawings. Where concrete, masonry or other materials must be set to exact locations to receive work, furnish assistance and directions necessary to permit other trades to properly locate their work. Where welded connectors, concrete or masonry inserts are required to receive work, shop drawings shall show exact locations required, and all such drawings shall be furnished to the trades responsible for installing the connectors or inserts. Catalogue work sheets showing illustrated cuts of item to be furnished, scale details and dimensions may be submitted for standard manufactured items.
 - 1. Provide templates for anchorage installations by others.
- C. Samples for Initial Selection: For products involving selection of color, texture, or design, including mechanical finishes.
- D. Samples for Verification: For each type of exposed finish required.
 - 1. Furnish finish samples of uncoated steel anchor and bolts for farm machinery, etc. Sections of each distinctly different linear railing member, including handrails, top rails, posts, and balusters.
 - 2. Fittings and brackets.
 - 3. 6 in. square piece of each finish required by this section.
- E. Certificates: Submit certification signed by California registered civil or structural engineer indicating compliance with Contract Documents and code requirements where required.

1.5 SYSTEM DESCRIPTION

- A. Design Requirements: Drawings indicate metal sizes and shapes; unless otherwise specifically indicated, design components and fabrications of gages and thicknesses to withstand anticipated loads as required by California Building Code.
 - 1. Railings: Support a lateral force of 50 lbs./lin. Ft. uniform load and 200 lbs. at any single point without permanent set or damage; ASTM E 935.
 - a. Top Rails: Design to support minimum 200 lb. concentrated single point load applied at any point vertically or horizontally.
- B. Rail Regulatory Requirements:
 - 1. Access: Comply with California Building Code and Americans with Disabilities Act Accessibility Guidelines (ADAAG) Access Requirements and finishes as designated by NAAMM "Metal Finishes Manual" and "Pipe Railing Manual" and referenced standards. Rails shall be welded construction; cap exposed ends.
 - 2. Building Code: Comply with requirements of applicable building codes for railing design, except where more restrictive codes are specified.

1.6 QUALITY ASSURANCE

- A. Fabricator Qualifications: Firm with minimum five years successful experience fabricating metal items similar to those required for Project.
- B. Source Limitations: Obtain each type of railing or screen from single source from single manufacturer.
- C. Product Options: Information on Drawings and in Specifications establishes requirements for system's aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including structural analysis, preconstruction testing, field testing, and in-service performance.

1. Do not modify intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If modifications are proposed, submit comprehensive explanatory data to Architect for review.

D. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.2/D1.2M, "Structural Welding Code-Aluminum."

E. Powder-Coating Applicator Qualifications: A firm experienced in successfully applying powder coatings of type indicated and employing competent control personnel to conduct continuing, effective quality-control program to ensure compliance with requirements.

F. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.

1. Build mockup of each type of metal shown on Drawings.
2. Build mockups for each form and finish of guardrail consisting of two posts, top rail, infill area, and anchorage system components that are full height and are not less than 24 inches in length.
3. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

G. Preinstallation Conference: Conduct conference at Project site.

1.7 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with railings by field measurements before fabrication and indicate measurements on Shop Drawings.

PART 2 - MATERIALS

2.1 BASIC MATERIALS AND ACCESSORIES

- A. Steel Tubing: ASTM A500 (cold-formed), Minimum Grade B, seamless where exposed.
- B. Steel Pipe: ASTM A53, Type S, seamless, Grade A, minimum standard weight, STD or Schedule 40, unless otherwise noted.
- C. Miscellaneous steel plates and structural steel shapes conforming to ASTM A36-(latest edition).
- D. Bolts: Structural grade steel, ASTM A307-(latest edition), with suitable hex nuts and washers, all galvanized except where noted otherwise.
- E. Structural Steel Sheet: Hot rolled, ASTM A1011; or cold rolled, ASTM A 1008, Class 1 of grade required for design loading.
- F. Castings: Gray iron, ASTM A 48, Class 30; malleable iron, ASTM A47.
- G. Concrete Inserts: Threaded or wedge type; galvanized ferrous castings, either malleable iron ASTM A47 or cast steel ASTM A27. Provide bolts, washers and shims as required, hot-dip galvanized, ASTM A153.
- H. Fasteners and Rough Hardware: Type as required for specific usage; provide zinc-coated fasteners for exterior use or where built into exterior walls.
- I. Welding Materials: AWS D1.1, type required for materials being welded.

- J. Stainless Steel
1. Plate, Sheet and Strip: ASTM A167, Type 316. Provide mill finish unless otherwise shown.
 2. Bars and Shapes: ASTM A276, Type 316. Provide mill finish unless otherwise shown.
 3. Tubing: ASTM A269
 4. Stainless Steel Railing Finishes: Submit finish sample for approval. Remove tool and die marks and stretch lines or blend into finish. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated free of cross scratches. Run grain with long dimension of each piece.
 5. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
- K. Aluminum: Provide alloy and temper recommended by aluminum producer or finisher for type and use and finish indicated; sized for strength and durability consistent with application involved. Comply with the following finishes as designated by NAAMM "Metal Finishes Manual" and referenced standards:
1. High performance Organic Coating: AA-C12C42R1x, prepared, pretreated and coated with minimum two coat system; AAMA 2605.
 2. Comply with following minimum standards for aluminum.
 - a. Extruded Bar and Shapes: ASTM B221, 6063-T6.
 - b. Extruded Pipe and Tube: ASTM B429, 6063-T6.
 - c. Drawn Seamless Tube: ASTM B483, 6063-T832.
 - d. Plate and Sheet: ASTM B209, 6061-T6.
 - e. Die and Hand Forgings: ASTM B247, 6061-T6.
 - f. Castings: ASTM B26, 356.0-T6.
- L. Weathering Steel: (COR-TEN), ASTM A242.
- M. Castings: Gray iron, ASTM A 48, Class 30; malleable iron, ASTM A 47.
- N. Screws: Galvanized zinc, electro-plated or brass.
- O. Welding Electrodes: As permitted by AWS A5.
- P. Galvanizing:
1. Hot-dip galvanize fabricated items as shown and specified after fabrication in accordance with ASTM A123-09, ASTM A153/A153M.
 2. Parts shall be made in suitable sections. First clean in a hot pickling bath to remove scale and then rinse clean with clear water. After pickling and washing, dip parts in liquid zinc tank sufficient length of time to heat parts to zinc temperature, then remove and allow to drip and cool; straighten as required.
- Q. Non-Metallic Shrinkage Resistant Grout: Premixed, nonmetallic, non-corrosive, non-staining, shrinkage resistant product containing selected silica sands, Portland cement, shrinkage compensating agents, plasticizing and water-reducing agents, complying with CE-CRD-C621 and ASTM C1107, free of gas-producing or gas-releasing agents, oxidizing catalysts, inorganic accelerators and chlorides. Provide one of the following:
1. "Five Star Grout" (U.S. Grout Corp.).
 2. "Masterflow 713" (Master Builders Co.).
 3. "Crystex" (L&M Construction Chemicals, Inc.).
- R. Fasteners and Anchorage Devices: Provide fasteners complying with the requirements of Industrial Fasteners Institute standards. Type, grade, class and style best suited for the respective purpose. Use countersunk flat-head Phillips type machine screws for exposed fasteners, except where Allen head screws are required. Use galvanized steel or stainless steel fasteners for exterior construction and for fastening components fabricated of galvanized steel except where specified otherwise. Fasteners exposed in finish surfaces to match finish of adjacent surfaces.

- S. Component Connections: Fabricate component connections to support specified design loads.
- T. Material Selection: Select materials for straightness, free of defects and irregularities.
 - 1. Exposed-to-view surfaces exhibiting pitting, seam marks, roller marks, "oil canning", stains, discolorations, and imperfections on finished units are not acceptable.
- U. Joints: Make exposed joints flush butt type, hairline joints where mechanically fastened; provide concealed connection devices with hidden fasteners.
 - 1. Fabricate continuous items with joints neatly fitted and secured.
 - 2. Ease exposed edges to approximate 1/32" uniform radius.
 - 3. Fabricate joints exposed to weather in manner to exclude water or provide weep holes where water could accumulate.
- V. Welding: Comply with AWS for recommended practices in welding each type of material; provide welds behind finished surfaces without distortion or discoloration on exposed side; dress exposed and contact surfaces.
- W. Exposed Mechanical Fastenings: Flush countersunk fasteners unobtrusively located, consistent with design of structure.
- X. Assemblage: fit and shop assemble in largest practical sections for site delivery.
- Y. Dissimilar Materials: Separate dissimilar materials with bituminous paint where concealed, with preformed separators, or similar method to prevent corrosion.

2.2 SPECIALLY FABRICATED PRODUCTS

- A. Railings and Handrails: Make all bar railings of milled steel unless noted otherwise; all connections welded. Where pipe railing is required, make from (1-1/2) outside diameter seamless steel pipe unless noted otherwise. Fabricate in largest sections feasible; all shop joints welded; all field joints with concealed sleeves and pins.
- B. Railings and Handrails Design: Continuous railings conforming to applicable code and design requirements. Construct to support a concentrated load of 250 lbs. Applied at any point and in any direction and for a uniform load of 50 lbs. Per foot applied in any direction. The concentrated and uniform loading conditions shall not be applied simultaneously.
 - 1. Wall Rail Brackets: Castings as accepted by Owner's Representative.
 - 2. Wall returns: 90 degree elbow return with 1/4" maximum clearance unless otherwise indicated.
 - 3. Provide wall plates only where indicated and where required by applicable codes.

2.3 SHOP PAINTING AND FINISHES

- A. General:
 - 1. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
 - 2. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipment
 - 3. Shop paint miscellaneous metal work, except members or portions of members to be embedded in concrete or masonry, surfaces and edges to be field welded unless otherwise specified.
 - 4. Remove oil, grease and all visible soluble surface contaminants in accordance with SSPC SP-1 "Solvent Cleaning", prior to any additional surface preparation specified.
 - 5. Clean and prepare metal surfaces before applying shop coat.
 - a. Bare Ferrous Steel: SSPC-SP6/NACE No. 3 Commercial Blast Clean to exhibit a dense, uniform and angular surface profile of 2.0 mils minimum.

- b. Galvanized, Stainless and Non-Ferrous Metal: SSPC-SP16 Brush-Off Blast Clean to create a dense, uniform and angular surface profile of 1.5 mils minimum.
 6. Immediately after surface preparation, apply primer in accordance with manufacturer's instructions. Use painting methods which will result in full coverage and dry film thickness specified.
 - a. Use wet film thickness gauges during application.
 7. Apply one shop coat of primer to fabricated metal items.. In addition, apply one shop coat of finish paint to entire surfaces of exterior loose lintels, shelf and relieving angles, dunnage and other items as noted or specified. Change color of second or finish coat to distinguish it from the first coat.
 8. Separate dissimilar metals with one coat of dielectric separator. Do not extend coating onto exposed or finished surfaces.
 9. Application: Do not paint when ambient temperature is below 40°F. Paint in dry weather or under cover; paint over dry rust-free surfaces. Stir paint and keep at uniform consistency during application. Zinc-rich primers require continuous mechanical agitation. Apply paint per manufacturer's directions to recommended or specified dry film thickness. Do not thin paint in excess of manufacturer's recommendations. Allow paint to dry before handling or shipment.
- B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.
- C. Provide exposed fasteners with finish matching appearance, including color and texture, of railings.
- D. Powder-Coat Finish: Powder Coating: Cowel nylon coating powder applied per manufacturer's recommendations for exterior applications. Color to be selected by landscape architect from manufacturer's full range and is to match trench drain powder coat color.
- E. High Performance Coatings: Primers, Intermediate and Finish paint coatings manufactured by Tnemec Company are specified as the basis of design. Local: Amos And Associates, Inc.: 816-317-3206.
- F. Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.
- G. Fully Concealed Items:
 1. Clean steel work by "Solvent Cleaning" method specified in SSPC-SP 1, followed by "Hand Tool Cleaning" to remove loose mill scale and rust by methods specified in SSPC-SP 2.
 2. Apply ferrous metal primer immediately after.
- H. Exposed Exterior Items:
 1. Apply the following cleaning, treatment and painting to exterior work which will be fully exposed or only partially exposed, and to exposed interior work in areas designated as high humidity areas.
 2. Clean by "Solvent Cleaning" method specified in SSPC-SP 1, followed by "Power Tool Cleaning to Bare Metal " to remove mill scale and rust by methods specified in SSPC-SP 11 when abrasive blast cleaning is not practical. Otherwise, prepare surfaces per SSPC-SP6/NACE No. 3 Commercial Blast Clean.
- I. Preparation of Galvanized Metal
 1. Shop or Field Surface Preparation:

- a. SSPC-SP1 Solvent Clean all surfaces to remove visible and soluble surface contaminants before and after subjecting surfaces to SSPC-SP16 Brush-Off Blast Cleaning of Coated and Uncoated Galvanized Steel, Stainless Steels, and Non-Ferrous Metals to create a dense, uniform and angular anchor profile of 1.5 mils minimum. When abrasive blasting is not practical, in lieu of SSPC-SP16, use power tools that create a surface profile and do not burnish the surface (i.e. Monti Power Bristle Blaster). However it is achieved, all surfaces shall be clean and free of all surface contaminants including passivated surfaces, shall be dry and shall be uniformly roughened to exhibit a dense and uniform anchor surface profile of 1.5 mils minimum before coating application. The purpose is not to remove zinc but to roughen the surface. If zinc is removed to expose substrate, bare substrate must be primed with a zinc-rich primer such as Tnemec Series 94-H2O | Hydro-Zinc.
 2. Power Tool clean cuts and welds to bright metal.
 3. Shop or Field Primer: Series L69 | Hi-Build Epoxoline II; 3.0 to 4.0 mils DFT (provide holdbacks as required for welding)
 4. Color Finish: Shop or Field Finish: Series 1070V | Fluoronar gloss or Series 1071V | Fluoronar semi-gloss or Series 1072V | Fluoronar satin (Color and Sheen TBD by Landscape Architect); 2.5 to 3.5 mils DFT
 5. Total DFT: 5.5 to 7.5 mils
- J. Preparation of Ferrous Metal
1. Surface preparation: SSPC-SP6/NACE No. 3 Commercial Blast Clean to create a dense, uniform and angular anchor profile of 2.0 mils minimum.
 2. Prime Coat: Series 94-H2O Hydro-Zinc or Series 90-97 Tnemec Zinc (meets Class B Slip for critical bolted connections); 2.5 – 3.5 mils DFT.
 3. Field Touch-Up Primer: Series 94-H2O Hydro-Zinc; 2.5 – 3.5 mils DFT
 4. Striping Existing Metal: Series L69 Hi-Build Epoxoline II brush applied to all bare and corroded surfaces, sharp edges, welds, nuts and bolts per SSPC-PA 1, 6.6 Striping, 7.4.6 Application Method.
 5. Intermediate Coat: Series L69 Hi-Build Epoxoline II; 4.0- 6.0 mils DFT.
 6. Color Finish: Shop or Field Finish: Series 1070V | Fluoronar gloss or Series 1071V | Fluoronar semi-gloss or Series 1072V | Fluoronar satin (Color and Sheen TBD by Owner); 2.5 to 3.5 mils DFT
 7. Total DFT: 8.0 – 13.0 mils

PART 3 - EXECUTION

3.1 CONDITION OF SURFACES: Inspect all surfaces to receive site metal work and report all defects which would interfere with this installation. Starting work implies acceptance of surfaces as satisfactory.

3.2 FIELD MEASUREMENTS: Take field measurements prior to preparation of shop drawings and fabrication, where possible; do not delay job progress; allow for trimming and fitting where necessary.

3.3 WORKMANSHIP

- A. Verify all measurements at job. Coordinate all metalwork with adjoining work for details of attachments, fittings, etc. Do all cutting, shearing, drilling, punching, threading, tapping, etc., required for site metalwork or for attachment of adjacent work. Drill or punch holes; do not use cutting torch. Shearing and punching shall leave true lines and surfaces. Obtain Owner's Representative's review prior to site cutting or making adjustments which are not part of scheduled work. Perform necessary cutting and altering for installation and coordination with other work.
- B. Conceal all fastenings where feasible. Thickness of metal and details of assembly and supports shall give ample strength and stiffness. Form joints exposed to weather to exclude water.

- C. Make all permanent connections in ferrous metal surfaces using welds where at all possible; do not use bolts or screws where they can be avoided.
- D. Provide all lugs, clips, anchors, miscellaneous fastenings necessary for complete assembly and installation.
- E. Set all work plumb, true, rigid, neatly trimmed out, accurately fitted and free from distortions or defects detrimental to appearance or performance. Miter corners and angles of exposed moldings and frames unless otherwise noted.
- F. Set railings where shown set in sleeves or cored with quick-setting non-shrink anchor cement. Size sleeves for approximately 1/4" clearance all around.
- G. Where items must be incorporated or built into adjacent work, deliver to trade responsible for such work in sufficient time that progress of work is not delayed. Be responsible for proper location of such items.
- H. Make provisions for erection stresses by temporary bracing; Keep work in alignment.
- I. Install ornamental metal items in accordance with manufacturer's recommendations, installation instructions, and approved shop drawings.
- J. Install items plumb, true and in correct relation to adjacent work, free from distortion or defects detrimental to appearance and performance.
- K. Prior to securing continuous items, adjust to ensure proper matching at butt joints and correct alignment throughout their length.
- L. Tolerances: Accurately align and locate components to required lines and levels to conform to following tolerances:
 - 1. Plumb: 1/8" in 10'-0"; 1/4" in 40'-0"; non-cumulative.
 - 2. Level: 1/8" in 20'-0"; 1/4" in 40'-0"; non-cumulative.
 - 3. Location: 3/8" maximum deviation from measured theoretical location (any member and location).

3.4 WELDING:

- A. Perform all welding in accordance with AWS Code D1.1. Welds shall be made only by operators experienced in performing the type of work indicated. Welds normally exposed to view in the finished work shall be uniformly made and shall be ground smooth. Where welding is done in proximity to glass or finished surfaces, such surfaces shall be protected from damage due to weld sparks, spatter, or tramp metal.
- B. Field Welding: Comply with AWS Welding Code for procedures related to field welding as related to appearance and quality of welds made and for methods used in correcting welding work. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals. Obtain fusion without undercut or overlap. Remove welding flux immediately. At exposed connections, finish exposed welds and surfaces smooth and blended so that no roughness shows after finishing and contour of welded surface matches those adjacent.

3.5 BOLTED, SCREWED AND RIVETED CONNECTIONS

- A. In general, use bolts for field connections only and then only as detailed. Provide washers under all heads and nuts bearing on wood. Draw all nuts tight and nick threads of permanent connections to prevent loosening. Use beveled washers where bearing is on sloped surfaces.
- B. Where screws must be used for permanent connections in ferrous metal, use flat-head-type, countersunk, with screw slots filled and finished smooth and flush.

- C. Where rivets are used, they shall be machine-driven, tight, heads centered, countersunk, and finished flush and smooth.

3.6 GALVANIZING

- A. Galvanize fabricated items after fabrication in accordance with ASTM A123-66.
- B. Parts shall be made in suitable sections. First clean in a hot pickling bath to remove all scale and then rinse clean with clear water. After pickling and washing, dip parts in liquid zinc tank sufficient length of time to heat parts to zinc temperature, then remove and allow to drip and cool; straighten as required.

3.7 INSTALLATION

- A. Coordinate and furnish anchorages, setting drawings, diagrams, templates, instructions and directions for installation of anchorages, including concrete inserts, sleeves, anchor bolts and other miscellaneous items having integral anchors that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to the project site. Deliver items which are to be built into the work of other Sections in time so as not to delay the progress of the Work.
- B. Protect finished surfaces against damage during construction and remove protection at time of substantial completion.
- C. Railings and Guardrails:
 - 1. Anchor posts of railings into concrete by means of pipe sleeves preset and anchored into concrete. Set sleeves in concrete with tops flush with finish surface elevations and protect sleeves from water and concrete entry. After posts have been inserted into sleeves, solidly fill annular space between post and sleeve with non-shrink non-metallic grout. Cover anchorage joint with a round steel flange welded to post after placement of anchoring material.
 - 2. Anchor posts to steel members with steel oval flanges, angle type or floor type as required by conditions, welded to posts and bolted to steel supporting members.
 - 3. Mount handrails only on completed walls. Do not support handrails temporarily by any means not satisfying structural performance requirements. Mount handrails only on gypsum board assemblies reinforced to receive anchors. Adjust railings prior to anchoring to ensure matching alignment at abutting joints. Locate posts at spacing indicated, or if not indicated, at equal intervals as required by design loadings.
 - 4. Secure handrails to wall with wall brackets and end fittings. Provide brackets of design shown, with flanges tapped for concealed anchorage and with not less than 1-1/2 in. clearance from inside face of handrail and finished wall surface. Located brackets as indicated, or if not indicated, at equal spacings as required by design loads.
- D. Loose Plates: Prior to setting loose bearing and setting plates, clean concrete and masonry bearing surfaces of any bond reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of plates. Set on wedges or other adjustable devices. After members have been positioned and plumbed, tighten anchor bolts. do not remove wedges or shims, but if protruding, cut off flush with the edge of the plate before packing with grout. Pack grout solidly between bearing surfaces and plates to ensure no voids remain.
- E. Immediately after erection, clean field welds, bolted connections, marred and abraded surfaces. Paint and touch-up paint with the specified paint system. Touch up galvanized surfaces in accordance with ASTM A780.
- F. Replace items damaged in course of construction.

3.8 PROTECTION AND CLEANING, per Section 017400

- A. Remove all soil and foreign matter from finished surface and apply such protective measures as may be required to prevent damage or discoloration of any kind until acceptance of project.

END OF SECTION

SECTION 328400 - PLANTING IRRIGATION

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Include: All labor, materials, supplies, tools and transportation to perform all operations in connection with and reasonably incidental to the complete installation of the automatic sprinkler irrigation systems as shown on the Drawings.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 RELATED SECTIONS:

- A. Final Acceptance for Work of this Section is contingent on completion of Work of Section 329000.
- B. Division 32 - Exterior Improvements: Irrigation sleeving under paving.

1.3 REFERENCES

- A. ASTM - American Society for Testing and Materials
 - 1. A53 - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
 - 2. D1785 - Standard Specification for Poly Vinyl Chloride (PVC) Plastic Pipe, Schedules 40 and 80 and Classes 200 and 315.
- B. ICC - International Code Council
- C. NEC - National Electric Code
- D. State of California, Division of Industrial Safety
 - 1. Electrical Safety Orders
- E. UPC - Uniform Plumbing Code

1.4 QUALITY ASSURANCE

- A. OSHA Compliance:
 - 1. All articles and services covered by this Specification shall meet or exceed the safety standards established under the Federal Occupational Safety and Health Act of 1970, together with all amendments in effect as of the date of this Specification.
 - 2. The Contractor shall erect and maintain barricades, guards, warning signs, and lights as necessary or required by OSHA regulations for the protection of the public or workmen.
- B. Regulatory requirements: In addition to complying with all pertinent codes and regulations, comply with the latest rules of NEC and the Electrical Safety Orders of the State of California, Division of Industrial Safety, for all electrical work and materials. The materials and methods to be used in constructing the irrigation system shall conform to the applicable provisions of the UPC.
- C. When the Specifications call for materials or construction of a better quality or larger size than required by the above-mentioned rules and regulations, the provision of the Specifications shall take precedence over the requirements of the said rules and regulations.

- D. The Contractor shall furnish without any extra charge any additional material and labor when required by the compliance with these rules and regulations, though the work be not mentioned in these Specifications or shown on the Drawings.
- E. The Contractor shall not willfully install the irrigation system as shown on the Drawings when it is obvious in the field that obstructions, grade differences or discrepancies in area dimensions exist that might not have been considered in engineering. Such obstructions or differences should be brought to the attention of the College's Authorized Representative. If this notification is not performed, the Contractor shall assume full responsibility for any necessary revisions.
- F. Any existing buildings, equipment, piping, pipe covering sewers, sidewalks, landscaping, etc., damaged by the Contractor during their work shall be replaced or repaired by the Contractor in a manner satisfactory to the College's Agent and at Contractor's own expense, and before the final payment is made. The Contractor shall be responsible for damage caused by leaks in the piping systems being installed by them. They shall repair, at their own expense, all damage so caused, in a manner satisfactory to the College's Agent.
- G. The Contractor shall pay for all permits, licenses, and fees required.

1.5 SUBMITTALS

- A. Equipment/Materials List: Within 15 days after award of contract and prior to installation, submit six copies of materials list. Include manufacturer, model number, and description of all materials and equipment. Include sealants, cements, lubricants, and other proprietary items. Manufacturer cut-sheets may be used with items clearly identified on each page.
- B. Contractor shall submit the Equipment/Materials List as one complete package with all equipment to be used on the project included. Submittals submitted in 'piecemeal' fashion shall be rejected.
- C. Equipment/Materials List shall include a Table of Contents at the beginning of the package listing all materials and components of the irrigation system with corresponding page number. Equipment Submittals will be rejected as incomplete if T. of C. is not included. Although manufacturer and other information may be different, the following is a guide to proper layout of submittal format:

Item No.	Description	Manufacturer	Model No.	
	Pg. No.			

1.	Backflow Preventor	FEBCO	825YA	1
2.	Mainline Isolation Ball Valve	LASCO	Vxx101N-SC	3
3.	QCV	Rain Bird	33-RC	5
4.	QCV Key	Rain Bird	33-DK	6

- D. Substitutions: Submit PDF copies of catalog information on materials which are to be submitted for substitution. No substitution will be permitted without prior written approval by the Architect. A complete material list shall be submitted prior to performing any work.
- E. Provide a copy of the completed submittal list within the Operation and Maintenance Manual.
- F. Unit Pricing Chart: The contractor shall provide a PDF copy as part of the Submittal Package to the College's Authorized Representative a 'Unit Pricing Chart' for installed equipment supplied to the project. Chart to be used for future add/deduct purposes that may occur during the construction of the irrigation system. Refer to section 1.6.
- G. Equipment or materials installed or furnished without prior approval of the College's Authorized Representative may be rejected and the Contractor required to remove such materials from the site at his own expense.

- H. Any manufacturer's warranties shall not relieve the Contractor of his liability under the Guarantee. Such warranties shall only supplement the Guarantee.
- I. As-built Plans:
1. The Contractor shall maintain in good order, in the field office, one complete set of blueprints of all irrigation drawings which form a part of the Contract.
 - a. Any work not installed as indicated on the Drawings, shall be recorded, and dimensioned accurately from the buildings/walls and/or curbs/sidewalks on 'as-built' prints. Including controllers, mainline routing, backflow assemblies, all valve box locations for master valves, flow sensors/meters, RCV assemblies, QCV's, mainline isolation valves, drip flush valves, drip air relief valves, and stub-outs.
 - b. All as-built markups shall be indicated in red.
 - c. All underground stub-outs for future connections and valves shall be located and dimensioned accurately from building walls on these record drawings.
 2. Upon completion of the work, on a new set of drawings, obtain reproducible prints from Architect and neatly correct the prints to show the as-built conditions.
- J. Record Drawings:
1. Upon approval of the 'as-built' drawings, produce the Record Drawings in electronic form on latest project base files using AutoCAD drafting software 2023 or later version and upon completion provide the Record Drawings in PDF format. After approval of the Record Drawings the contractor shall finalize the Record Drawings to be included in the O&M manual.
 - a. If unable to complete an electronic form of the Record Drawings deliver an approved hardcopy of the 'As-built' Record Drawings to Irrigation Consultant, Brinkerhoff and Associates, (760) 703-7108. Brinkerhoff and Associates shall provide the Contractor electronic drafting as a separate service. Service fee shall be according to project size. Brinkerhoff and Associates shall determine the fee and Contractor shall pay the fee before work commences. Brinkerhoff and Associates shall input 'As-built' Record Drawing information from Contractor into the electronic base files using AutoCAD 2024 drafting software or later version. After completion Brinkerhoff and Associates shall e-transmit the electronic Record Drawings and provide a PDF file of the irrigation sheets to the Landscape Architect and/or Contractor.
 2. For Record Drawings include new valve callouts at the actual as-built RCV locations. Remove all 'old' callouts, RCV's, and original mainline routing from the Record Drawings to declutter the drawing. Also, include the actual measured flow for each RCV for future troubleshooting purposes.
 3. Include any wording, documentation in the Title Block and/or sheets as required by College and/or Landscape Architect.
 4. Include a box, with text wipeout feature to minimize clutter, with an abbreviated Legend of the equipment and line types on each sheet for easy identification.
- K. Controller Irrigation Zone Charts:
1. Record Drawings shall be accepted by the Architect before controller charts are prepared.
 2. Provide one controller chart for each controller supplied.
 3. Prior to Pre-Maintenance Substantial Completion Observation, prepare Controller Irrigation Zone Chart from a reduced copy of the approved Project 'As-Built' Record Drawings produced from AutoCAD software, with irrigation zones clearly highlighted in differing colors and each valve number clearly highlighted at the reduced scale produced from AutoCAD software to the Landscape Architect for review and approval. After approval, the Contractor shall produce the same chart for use within the controller cabinet. The reduced zone plan shall be cut to fit flat within the controller; each sheet laminated in plastic and placed in the controller before the Pre-maintenance site review. Size of project shall determine number of sheets. If more than one sheet is required, then sheets shall be attached together with a key ring.

4. If unable to complete an electronic form of the colored zone chart deliver a hand-colored chart produced from an approved hardcopy of the 'As-built' Record Drawings to Irrigation Consultant, Brinkerhoff and Associates, (760) 703-7108. Brinkerhoff and Associates shall provide electronic drafting as a separate service to the Contractor. Service fee shall be according to project size. Brinkerhoff and Associates shall determine the fee, and Contractor shall pay the fee before commencing work. Brinkerhoff and Associates shall input controller zone information from Contractor into the electronic approved Record Drawing files using AutoCAD 2023 drafting software or later version. After completion, Brinkerhoff and Associates shall provide a PDF file of the zone chart to the Landscape Architect and/or Contractor.

Charts shall be the maximum size that the controller door will allow, showing areas covered by each controller. The chart shall be an electrostatic copy and a different color shall be used to indicate area of coverage for each station. Enlarge valve sequence to be readable when drawing is reduced.

After being completed and accepted, seal by plastic laminating. Laminating sheets shall be a minimum of 5 mil thick.

- L. Controller Anticipated Run-Time Schedule Chart:
 1. At or prior to the Final Substantial Completion Observation Review, provide a 12-month controller run-time schedule chart for each IRRIGATION ZONE on the controller to the Irrigation Consultant for review and approval. After approval, place on back side of color-highlighted approved Controller Irrigation Zone Chart and laminate together. Anticipated Controller Run-time Schedule Charts shall be developed using historical evapotranspiration rates for the area, individual zone precipitation rates, necessary crop factors, and irrigation system efficiencies by zone as the basis for the schedule and shall show such within the chart. If repeat cycles are required due to runoff issues, note the proper number of repeat operations and the timing of each repeat. The total run time for all daily cycles shall not be longer than the maximum allowed water window per local water agency regulations. The watering days per week or month shall be such as to permit system operation to be close to the maximum water window allowed.
 - a. Brinkerhoff and Associates, Irrigation Consultants (760-703-7108), shall provide a service to produce Controller Run-time Schedule Charts at Contractor's request. Service fee varies depending on the total zone count for each controller.
- M. Operations and Maintenance Manual:
 1. Deliver a PDF file to the Landscape Architect at least 5 days prior to Final 'Walk-Through' and completion of construction a complete set of the following data.
 - a. *Index:* Include sheet stating installing Contractor's address and telephone number and a full Table of Contents with section identifying index tabs showing page groupings. Show all page numbers within each section. Sections may be taken from numbered headings as shown below. Individual page numbers shall be placed on every sheet. Every page shall be numbered sequentially starting with 1 to the last page. No page shall have the same number. Place page number at the bottom right corner of each page. i.e. example of SECTION HEADINGS (examples of Sections only, Section page numbering will differ.)

Warranty Certificate	page 5
Manufacturers' Warranty Certificates	pages 6-12
Record Drawing	page 13
Approved Submittal Lists	pages 20-30
Catalog Materiel Cut Sheets	pages 31-100
Installation, Operation, Maint, & Trblshting	pages 120-350
Controller	pages 120-310
Backflow Assembly	pages 311-319
Master Valve	pages 320-325
Flow Sensor	pages 326-329
RCV's	pages 330-333
QCV's	pages 334-336
Dripline	pages 337-350

Etc.

- b. Name and Addresses: Include list of equipment with name, email address, and physical addresses of local manufacturer's representatives and name, address, and phone number of local supplier of irrigation materials used on the project.
- c. Warranty Certificate: Include contractor's irrigation system warranty certificate.
- d. Manufacturers' Warranty Certificates: Include manufacturer's equipment warranty certificates including controller.
- e. Testing and Commissioning: Include all documents pertaining to the testing and commissioning of the irrigation system, i.e. certifications for pump assembly, backflow assembly, controller assembly, etc.
- f. Record Drawings: Include 11x17 sheets of the Final Record Drawings. Record Drawings only to be completed from the landscape architect approved set of as-built plans.
- g. Irrigation Plan As-built's: Include 11x17 sheets of the As-built drawings.
- h. WELO Certificate of Completion: Include document as approved by the prevailing City/Water Agency.
- i. WELO Irrigation Inspection and Audit Report: Include report conducted by an Irrigation Association certified (CLIA) third-party Water Auditor.
- j. List of Extra Stock: Include all extra products supplied as part of the "Turn Over Items". List by manufacturer, model, and quantity.

- k. Catalog Material Cut Sheets: Include all products used on the project. Copies of all material submittals meet the requirement.
 - l. Approved Submittal List: Copy of the Irrigation Consultant Approved Submittal Equipment/Materials List(s).
 - m. Catalog Material Cut Sheets: Include all products used on the project. Copies of all material submittals meet the requirement.
 - n. Installation, Operation, Maintenance, & Troubleshooting: Include specific manufacturer's Installation, Operation, Maintenance, and Troubleshooting manuals for each product.
 - 1) Controller Assembly: Include specific manufacturer's Installation, Operation, and Maintenance Manual for the product.
 - 2) Decoders: Include specific manufacturer's operation and maintenance manual for the decoders.
 - 3) Backflow Assembly: Include specific manufacturer's maintenance manual for the assembly.
 - 4) Remote Control Valves (RCV's): Include specific manufacturer's operation, maintenance manual, and parts list breakdown for the product. Include manufacturer's "Valve Troubleshooting Guide".
 - 5) Sprayhead Bodies: Include specific manufacturer's operation and maintenance manual and parts list breakdown for the bodies.
 - 6) Sprayhead Nozzles: Include specific manufacturer's operation and maintenance manual for the spray nozzles.
 - 7) Rotary Nozzles: Include specific manufacturer's operation and maintenance manual for the rotator nozzles.
 - 8) Bubbler/Emitter Nozzles: Include specific manufacturer's operation and maintenance manual for the bubbler/Emitter nozzles.
 - o. Controller Zone Chart: Chart(s) shall include all zones separated by different colors easily readable at a 11x17 size. Provide the same zone chart(s) included in the controller cabinet.
 - p. Controller Watering Schedule Chart: Provide a 12-month watering schedule for maintenance crew reference. Include and separate each zone of the complete system. Show run time for each zone. Base each zone's runtime on ET factors and environmental constraints such seasons, sunny areas, shaded areas, plant types, etc.
 - q. Record and chart the 2-wire path ground resistance at each grounding point to provide a baseline resistance measurement from which to set expectations for future troubleshooting. Refer to '2-WIRE PATH DECODER GROUNDING' Subsection 3.16 & 3.17.
 - r. Establish and record a baseline operating pressure from which to set expectations for future troubleshooting. Record and chart the dynamic pressure (zone under operation) of every zone. Set up a pressure gauge at the end of each zone. (1.) Overhead system: last sprinkler (2.) Drip system: farthest zone flush valve.
2. Provide an Irrigation Maintenance Schedule to include, but not be limited to, routine inspection, adjustment, and repair of the irrigation system and its components. See sample chart below. *List only activities pertinent to this project.

IRRIGATION SYSTEM MAINTENANCE SCHEDULE CALENDAR					
ITEM	ACTIVITY	DAILY	WEEKLY	MONTHLY	YEARLY
1	Check system for leaks.	X			
2	Check for broken or vandalized sprinklers.	X			
3	Check for vandalism within other parts of the system.	X			
4	Test operate complete system to check for operational issues and nozzle alignment issues.		X		
5	*Check any tree deep-well bubbler tubes for standing water (before any zone operation). If found adjust zone run time to eliminate standing water.		X		
6	*Check and adjust sub-surface dripline tie-down U-stakes. Pedestrian traffic and other sources may displace driplines from intended position.		X		

7	<p>*Check and adjust sub-surface dripline location and depth. Pedestrian traffic and other sources may displace driplines from intended position.</p>		X		
8	<p>*Check and adjust 1/4" distribution tubing location and depth. Pedestrian traffic and other sources may displace tubing from intended position.</p>		X		
9	<p>*Check and adjust 1/4" distribution tubing stakes. Pedestrian traffic and other sources may displace tubing from intended position.</p>		X		
10	<p>*Check spot drip emitters for missing PC diffuser caps for systems which use the PC diffuser caps. Pedestrian traffic, vandalism, and other sources may displace caps from the emitter.</p>		X		

11	<p>*Rain Bird Basket Screen Filters: Check drip filter indicator (must be observed during zone operation only) for green or red colored indicator on top of filter. If all green, no further action required. If green/red mix flush filter element. If all red, flush or replace the 200-mesh filter element with a new unit. When flushing element also flush debris from inside filter body as may be required.</p>			6-9 MONT HS	
12	<p>*Netafim Disc Filters: Open filter housing and flush filter rings. When flushing element also flush debris from inside filter body as may be required.</p>			6-12 MONT HS	
13	<p>*Rain Bird Basket Screen Filters: Flush or replace filter elements-see #11. (when the filter indicator says flushing is required).</p>			6-9 MONT HS	
14	<p>Flush system piping for each drip zone via the flush valves.</p>	<p>AFTE R ANY</p>		3-4 MONT HS	

		REP AIR			
15	Clean out all equipment valve boxes, including debris and excess dirt that has filtered in the valve box for ease of equipment maintenance.				X
16	Reset all valve box heights to specification.				BI-Y EAR LY
17	Conduct irrigation audit to determine if irrigation system is within the expected efficiency parameters set forth in CA AB1881 (W.E.L.O.).				5 YEA RS

N. Equipment to be furnished:

1. Supply as part of this contract the following tools:
 - a. Two (2) sets of special tools required for removing, disassembling, and adjusting each type of sprinkler and valves supplied on the project.
 - b. Two (2) 5-foot valve keys for operation of ball/gate valves.
 - c. Two (2) keys for each automatic controller and controller enclosure.
 - d. Two (2) quick coupler keys with corresponding sized bent-nose garden hose bibb / hose swivel.
2. The above-mentioned equipment shall be turned over to the College at the conclusion of the project. Before the Final Walk-Through is performed, evidence that the College has received this material must be shown to the College's Authorized Representative.

1.6 UNIT PRICING

- A. As part of the submittal review process the contractor shall provide a PDF copy as part of the Submittal Package to the Landscape Architect / Owner's Authorized Representative with a 'Unit Pricing Chart' for installed equipment supplied to the project. The contractor shall review the irrigation legend and details and provide the required unit pricing matrix. The chart shall include items required in constructing the irrigation system for this project. The following chart may be used as a template. Need only to include the equipment/material items to be used on this project.

UNIT PRICING CHART

1.7 LAYOUT OF WORK

- A. The irrigation Contractor shall stake out the irrigation system as shown on the Drawings. Stake locations shall be approved by Landscape Architect before construction is started. Any changes, deletions or additions shall be determined in this check.

1.8 GROUNDING

- A. In all cases, where it does not conflict with appropriate grounding grid design for the site in question, ground rods or plates as referred to in this specification shall conform to the following standards.:
 1. The installer shall follow the manufacturer's grounding specifications.
 2. The installer shall provide adequate earth ground.
 - a. Resistance readings of 10 ohms or less are desirable, and a reading of no more than 15 ohms is required at all grounding points including the 2-wire and chassis ground.
 - b. The installer shall comply with practices defined in the American Society of Irrigation Consultants Earth Grounding Electronic Equipment in Irrigation Systems-Guidelines, available at www.asic.org.
 3. The installer shall install a ground rod or ground plate every 450-500 feet on the two-wire, and on the end of every spur that exceeds 50 feet. In high lightning areas, grounding should be increased to one every 300 feet.
 4. Grounding rods shall be located the length of the grounding rod away from the two-wire path.
 - a. There shall be a 6-gauge bare copper wire connecting the grounding rod to the surge arrester.

5. Grounding plates shall be located a distance equal to the diagonal measurement of the grounding plate from the two-wire path. The longest side of the grounding plate shall run parallel to the two-wire path.
 - a. There shall be a 6-gauge bare copper wire connecting the grounding plate to the surge arrester.
6. The surge arrester shall be located in a valve box and shall not be built into the decoder.

1.9 INSTRUCTION

- A. After the system has been installed and approved, the Contractor shall instruct the College's representative in complete operation and maintenance of the irrigation system.
- B. During the maintenance period, the Contractor shall be responsible for the set up and implementation of a formal education and training period (1 day) for the benefit of the College's landscape maintenance staff or other College designated representative. The purpose of the training shall be to explain the function and operation of equipment as may be necessary to fully understand the operation of the irrigation system. The education and training shall be to the satisfaction of the College's landscape maintenance staff or other College designated representative. The maintenance period may continue, at the College's discretion, until College's landscape maintenance staff or other College designated representatives are trained to their satisfaction. Items covered should include but not be limited to the following:
 1. Irrigation controller's features and its capabilities.
 2. Irrigation controller's ET sensor and its capabilities.
 3. Controller programming techniques and sequences.
 4. Review current watering schedules (pre-establishment) and informed explanation why it is such.
 5. Review and instruction for future watering schedules (post-establishment) and informed explanation why it is such.
 6. Troubleshooting techniques for minor controller issues.
 7. Operation of RCV's.
 8. Operation of QCV's.
 9. Operation of flow sensor or hydrometer valve.
 10. Proper drip zone flushing technique.
 11. Review and familiarization of drip system components and their operation, including filters, inline tubing, emitters, and multi-outlet manifolds.
 12. Set up a required schedule calendar for drip filter review and zone flushing frequency.
 13. Troubleshooting techniques for minor valve issues.
 - a. Valve won't open.
 - b. Valve won't close.
 - c. Valve is leaking.
 - d. Solenoid replacement.
 - e. Adjustment and replacement of sprinkler nozzles.
 - f. Troubleshooting techniques for minor sprinkler issues.

1.10 WARRANTY

- A. Provide 1-year guarantee for Work of this Section in accordance with Section 1700.
- B. Provide supplemental guarantee, on Contractor's letterhead:
 1. Warrant that irrigation system has been installed according to Drawings and Specifications, and that system will be free of defects in products and installation for 1 year from Substantial Completion. Manufacturer's warranties shall only supplement special warranty.
 2. Agree to repair or replace defective Work, or adjacent work which is damaged by such defects, with the exception of ordinary wear and tear, abuse or neglect. This includes damage to site improvements caused by settlement of improperly compacted trench backfill.
 3. The College reserves the right to make temporary repairs as required.

PART 2 - MATERIALS

2.1 PVC PIPE AND FITTINGS-MAINLINE

- A. Use rigid, unplasticized polyvinyl chloride (PVC) 1120, 1220 National Sanitation Foundation (NSF) approved pipe, extruded from material meeting the requirements of Cell Classification 12454 A or 12454 B, ASTM Standard D1784, with an integral belled end.
- B. Where shown on the Drawings use Schedule 40 conforming to the dimensions and tolerances established by ASTM Standard D1785 for mainline pipe. Refer to Drawings.
- C. Where shown on the Drawings use Class 315, SDR 13.5, rated at 315 PSI, conforming to the dimensions and tolerances established by ASTM Standard D2241 for mainline pipe. Refer to Drawings.
- D. Use PVC SCH 40 for mainline fittings with a nominal diameter equal to 1-1/2 inches or less.
- E. Use PVC SCH 80 for mainline fittings with a nominal diameter of 2 inches to 2-1/2 inches, Type 1, PVC solvent weld fittings conforming to ASTM Standards D2466 and D1784.
- F. Use SCH 80, Type 1, PVC for all threaded fittings up to 2-1/2 inches.
- G. Use primer approved by the pipe manufacturer. Solvent cement to conform to ASTM Standard D2564.
- H. The INLET tee/el fitting and SCH 80 nipple used to connect a remote-control valve manifold assembly to the main line shall be of the same size as the nominal diameter of the OUTLET LATERAL of the valve. Use SCH 80 Soc x Fipt female adapter, SCH 80 Mipt x Fipt reducer (T.T.) bushing and SCH 80 nipple as required to connect the remote-control valve to the inlet SCH 80 nipple.
- I. Lateral lines (non-pressure) shall be Schedule 40 polyvinyl chloride (PVC) plastic pipe, Type 1, and shall conform to ASTM D1784. Use Schedule 40 PVC solvent weld fittings.
- J. Metal Pipe:
 - 1. Where indicated in the drawings, steel pipe shall be Schedule 40 galvanized steel conforming to ASTM 53B. Metal pipe shall be wrapped in 2-inch wide, 20 mil thick, black PVC all weather corrosion-resistant tape with high tack adhesive. Use threaded galvanized steel fittings.
 - 2. Where indicated on the Drawings, use red brass screwed pipe conforming to Federal Specification #WW-P-351.
 - 3. Brass fittings shall be red brass conforming to Federal Specification #WW-P-460.
 - 4. Copper pipe shall be Type K conforming to ASTM B88 with solder joint type wrought copper fittings.
 - 5. Provide dielectric fittings where dissimilar metals come into contact.
- K. Fittings:
 - 1. Solvent Weld socket fittings: CL315 for pipe size larger than 2-1/2". Schedule 40, Type 1, Grade 1, PVC and shall conform to ASTM D2466. Schedule 80, Type 1, Grade 1 PVC and shall conform to ASTM D2467. Solvent cement and primer for PVC solvent-weld pipe and fittings shall be of type recommended by pipe manufacturer.
- L. Connections between main lines and remote-control valves shall be of Schedule 80 PVC (threaded both ends) nipples and fittings.
- M. Risers shall be as follows: Schedule 80 PVC threaded nipples and Schedule 80 PVC ells as shown on the construction details.

2.2 PIPELINE LOCATION MATERIALS

- A. Detectable Marker Tape- Plastic marker tape shall be 5 mil minimum thickness with a solid aluminum core of .35mil minimum thickness and a minimum width of 2". The background of the tape shall be colored based on pipe service with black lettering continuously printed. Marker tape shall have a minimum 35 lbs./inch tensile strength. The installation of the tape shall be at 18 inches below finish grade.

2.3 QUICK COUPLING VALVES

- A. Quick Coupling valves shall be brass construction, 3/4-inch connection, one piece body, non-locking vinyl top, single / double track key slot.
- B. Provide two 3/4-inch keys with 3/4" bent-nose garden valve, Buckner, model I-401, or Arrowhead Brass, model GV75F-V attached.
- C. QCV swing joint assemblies shall consist of brass nipples and fittings.
- D. Provide two Rain Bird cover keys, model #2049I per project when locking covers are specified.
- E. As listed in the Drawings. Refer to irrigation legend for manufacturer type and model.

2.4 GATE VALVES

- A. 2½ inch and smaller shall be 125 PSI CSP bronze construction conforming to ASTM B 62 with screw-in bonnet, non-rising stem, threaded connections.
- B. Gate valves are to be installed for mainline isolation.
- C. As listed in the Drawings. Refer to irrigation legend for manufacturer type and model.

2.5 BALL VALVES

- A. Ball valves shall be Schedule 80 PVC full port design.
- B. PVC ball valves are to be installed for manifold shutoff or upstream of the remote-control valve when only one valve is installed on the mainline.
- C. As listed in the Drawings. Refer to irrigation legend for manufacturer type and model.

2.6 REMOTE CONTROL VALVES

- A. Remote control valves shall be globe pattern constructed of heavy-duty glass-filled reenforced nylon with fabric-reinforced EPDM diaphragm and stainless-steel bolts with internal and external bleed. Operating pressure shall be 20 to 200 psi and flow range shall be 0.10-200 GPM as determined by manufacturer and valve size. All internal parts shall be removable from the top.
- B. When shown in drawings, install pressure regulating module on remote control valves. Pressure regulating module shall be by same manufacturer as remote control valve.
- C. Two SCH 80 unions shall be part of the valve assembly as shown in the drawings. Unions shall be installed within valve box for easy access.
- D. Each valve shall have a plastic tag denoting its controller and station number.
- E. RCV as listed in the Drawings. Refer to irrigation legend for manufacturer type and model.

2.7 REMOTE CONTROL DRIP VALVE ASSEMBLIES

- A. Remote control valves shall be globe pattern constructed of heavy-duty glass-filled reenforced nylon with fabric-reinforced EPDM diaphragm and stainless-steel bolts with internal and external bleed. Operating pressure shall be 20 to 200 psi and flow range shall be 0.10-200 gpm as determined by manufacturer and valve size. All internal parts shall be removable from the top.
- B. A 74-micron (200 mesh) screen filter shall be part of the valve assembly as shown in drawings.
- C. Install pressure regulating module on drip/micro-spray valve assembly as shown on drawings.
- D. Two SCH 80 unions shall be part of the valve assembly as shown in the drawings. Unions shall be installed within valve box for easy access.
- E. Each valve shall have a plastic tag denoting its controller and station number.
- F. Assembly shall include two interlocking valve boxes. Bottom box shall be inverted.
- G. RCV assembly as listed in the Drawings. Refer to irrigation legend for manufacturer's type and model of each component of assembly.

2.8 DECODER CONTROL CABLE

- A. 2-wire decoder cable. As listed in Drawings.
- B. 2-wire decoder cable shall be installed within 1-1/4" electrical conduit.
- C. Splices shall be made with SPEARS DS-400 connectors.

2.9 SYSTEM GROUNDING

- A. Decoders:
 - 1. Decoder grounding equipment includes a copper ground plate and 50 pounds of PowerSet® earth contact material. Make connections with CadWeld®. No other connections shall be approved.
- B. Splices shall be made with SPEARS DS-400 connectors.

2.10 2- WIRE CABLE SYSTEM GROUNDING

- A. Controller Unit:
 - 1. The grounding circuit will include an 8'copper-clad steel ground rod, a copper ground plate, #6-gauge wire, and 100 pounds of PowerSet® earth contact material. Make connections with CadWeld®. No other connections shall be approved.
- B. Grounding Rods and Plates:
 - 1. All grounding rods shall be bare copper 5/8-inch diameter or greater and a minimum of 8 feet long or longer.
 - 2. A 10-inch round valve box shall be installed over the top of the grounding rod to facilitate the use of a clamp-on ground resistance tester.
 - 3. All grounding plates shall be a minimum of 5 square feet (1.5 m²) as outlined in ASIC Earth Grounding Electronic Equipment in Irrigation Systems-Guidelines.
 - 4. A 10-inch round valve box shall be installed over the top of the ground plate connection to facilitate the use of a clamp-on ground resistance tester.

5. Grounding rods and plates shall be located at a minimum distance from the two-wire to assure that the two-wire path is outside of the electrode sphere of influence. Refer to Grounding Detail in Irrigation Plans for required distances.
 6. Consult the ASIC Earth Grounding Electronic Equipment in Irrigation Systems- Guidelines for correct minimum recommended distances for different ground rod or ground plate sizes and grounding grid designs.
 7. Make rod/wire connections with CadWeld®. No other connections shall be allowed.
- C. Splices shall be made with SPEARS DS-400 connectors.
- D. Surge Arrestors:
1. The surge arrestors shall be fully sealed, submersion proof made for direct bury, and shall effectively seal moisture from electronics. The surge arrestors shall be installed as specified herein.
 2. The surge arrestor shall come with 2 levels of surge protection that will clamp at 60 volts in less than 1 microsecond.
 3. The surge arrestor shall clamp closed to dissipate all surges to earth ground and protect other devices on the two-wire path.
 4. Each surge arrestor shall come with 23 inches of 16-gauge PVC jacketed solid core wire to connect to the two-wire path.
- E. Pedestal Enclosure Grounding:
1. If the controller enclosure is within 25 feet of an existing building, and does not conflict with appropriate grounding grid design for the site in question, the unit shall be grounded as outlined below:
 - a. The ground lug, located in the interior on the back panel in the lower-left corner under the AC power box in the pedestal cabinet, shall be connected directly to the building ground using a bare copper wire of 6-gauge or, as outlined in article 250 of the National Electric Code (NEC™) such that a single point of connection with the building ground is achieved.
 2. If the pedestal enclosure is mounted at a remote location, more than 25 feet away from a building or grounded AC power source, a 6-gauge bare copper grounding shall be connected from the ground lug to an appropriate grounding rod as outlined in the sections above, and in conformance with the ASIC Earth Grounding Electronic Equipment in Irrigation Systems-Guidelines:
 - a. The 6-gauge solid conductor may not exceed a minimum of an 8-inch radius bend at any point along the wire.
 - b. The 6-gauge solid conductor shall not be coiled.
 3. At this grounding point, resistance readings of 10 ohms or less are desirable, and a reading of no more than 15 ohms is required.

2.11 VALVE BOXES

- A. High density polyethylene construction with UV inhibitors. Lid shall be purple (RW) in color in turf and purple (RW) in color in shrubs, with stainless steel bolt-down mechanism. Boxes, lids, and bolts shall be from the same manufacturer.
- B. Boxes shall have an interlocking feature that locks two together when boxes are fitted bottom to bottom.
- C. Boxes shall have extra wide flange along bottom for enhanced stabilization.
- D. Boxes shall have beveled edges to prevent damage from lawn equipment.
- E. Boxes shall have extra wide flange along bottom for enhanced stabilization.
- F. Commercial grade plastic valve boxes shall be the 'VB' series manufactured by Rain Bird, or equal exactly in size and quality.

G. The lid shall be marked as follows:

1. Master Control Valve - "MV" in one inch (1") high white enamel or heat branded letters.
2. Flow Meter - "FM" or "FS" in one inch (1") high white enamel or heat branded letters.
3. Ground Rod - "GRD" in one inch (1") high white enamel or heat branded letters.
4. Remote Control Valve - "RCV" with the station number in one inch (1") high white enamel or heat branded numbers and letters.
5. Quick Coupler Valve - "QCV" in one inch (1") high white enamel or heat branded letters.
6. Mainline Isolation Shutoff Ball Valve - "BV" in one inch (1") high white enamel or heat branded letters.
7. Mainline Isolation Shutoff Gate Valve - "GV" in one inch (1") high white enamel or heat branded letters.
8. Fertigation Injector Assembly - "FERT" in one inch (1") high white enamel or heat branded letters.
9. Drip Manifold, Trees - "DRIP" in one inch (3/4") high white enamel or heat branded letters.
10. Drip Flush Valves- "FV" with the station number in one inch (1") high white enamel or heat branded letters.
11. Electrical Splice Box - "WIRE" or "ELECT" in one inch (1") high white enamel or heat branded letters.

H. Valve box sizes as noted on drawing details.

2.12 SPRINKLER HEADS AND BUBBLERS

- A. All sprinkler head types and nozzles shall be as listed on the Drawings.
- B. All pop-up sprinkler heads shall have internal check valves, and pressure regulation built into the sprinkler head, whether listed on the drawings or not.
- C. For all pop-up type sprinklers, the riser length shall be a 6" pop-up type for turf areas, 6" pop-up type for tree bubblers, and 12" pop-up type for shrub areas and 'No-Mow' bio-retention turf areas, whether listed as such on the drawings or not.
- D. Bubblers shall be as listed on the Drawings and shall be pressure compensating.

2.13 DRIP SYSTEM

- A. Provide all components required for complete system: As listed in the drawings.
 1. Screen Filter: Corrosion resistant plastic housing, 1-inch FIPT/MIPT connections with removable stainless-steel screen. The screen shall be 200 mesh. Refer to irrigation legend for manufacturer and model.
 2. Pressure regulator: Constructed of thermoplastic with stainless steel compression spring and securing screws. Pre-set to maintain constant outlet pressure of 40 psi.
 3. End Flush Valve Assembly: Manual flush valve assembly. As listed in the Drawings.

2.14 POINT SOURCE IRRIGATION

- A. Provide low-volume point-source emission devices, manufactured by GPH Products to efficiently deliver irrigation water at the plant root zone as indicated on construction plans.
- B. As listed in the Drawings. Refer to irrigation legend for manufacturer and model.
- C. Emitters shall regulate flow to 0.50, 1, 2, or 4 GPH. Refer to drawings for manufacturer, sizes, types, and quantities.
- D. Point source system accessories including PVC nipples, 1/2" check valves, PVC flex hose, poly flex hose, and PVC flex hose fittings shall be of manufacturer, model, and type as shown in the legend and as shown in the details.

2.15 MISCELLANEOUS INSTALLATION MATERIALS

- A. Solvent cement and primer for solvent weld joints shall be of make and type approved by manufacturer(s) of pipe and fittings. Cement shall be maintained at proper consistency throughout use.
- B. Pipe joint compound shall be non-hardening, non-toxic materials designed specifically for use on threaded connections in water carrying pipe. Performance shall be same as Rector Seal 100 W.
- C. Valve box drain rock: 3/4-inch washed gravel.
- D. Bedding material for mainline: Standard clean sand

2.16 MISCELLANEOUS EQUIPMENT

- A. Provide all equipment called for by the Drawings.
- B. Provide to the College, at completion of the Maintenance Period, three (3) each of all operating and servicing keys for both controller cabinets and enclosures, and wrenches required for complete maintenance and operation of all heads and valves. Include all wrenches necessary for complete disassembly of all heads and valves.
- C. Provide quantity of quick coupler keys as described in **2.3 QUICK COUPLING VALVES** above.

PART 3 - INSTALLATION

3.1 PREPARATION

- A. Schedule and coordinate placement of materials and equipment in a manner to effect the earliest completion of work in conformance with construction and progress schedule.
- B. The Contractor shall field verify the static water pressure at the project site prior to commencing work or ordering irrigation materials. If the Contractor fails to verify static water pressure prior to commencing work, Contractor shall assume responsibility for all costs required to make system operational.
- C. Examine areas and conditions under which work of this section is to be performed. Do not proceed with work until necessary conditions have been corrected.

3.2 HANDLING AND STORAGE

- A. Protect work and materials from damage during construction and storage as directed by Architect.
- B. Handle plastic pipe carefully; especially protecting it from prolonged exposure to sunlight.
- C. Store sub-surface dripline and polyethylene tubing in cool dry place out of sunlight during installation.

3.3 LAYOUT

- A. Layout work as accurately as possible in accordance with diagrammatic drawings.
- B. Where site conditions do not permit location of piping, valves and heads where shown, notify Architect immediately and determine relocation in a joint conference.
- C. Run pipelines and automatic control wiring in common trenches whenever practical.

3.4 EXCAVATING AND TRENCHING

- A. Excavation shall be in all cases ample in size to permit the pipes to be laid at the elevations intended and to permit ample space for joining.
- B. Minimum Depth of trenches shall be enough to provide minimum cover from finish grade to top of pipe in trenches, as follows:
 - 1. 18-inch minimum cover over main lines to the control valves and quick coupling valves.
 - 2. 18-inch minimum cover over direct burial control wires from controller to valves.
 - 3. 12-inch minimum cover over the lateral lines to sprinkler heads.
 - 4. 24-inch minimum cover over sleeves.
- C. For actual depth requirements refer to irrigation drawings for exact depths as determined by pipe use (mainline, under pavement, sleeving, lateral line) and pipe size.
- D. When considering depth, the Contractor shall be aware that all mainline pipe 3" and larger shall have 4 inches of surrounding backfill material.
- E. When considering depth, Contractor shall be aware that all pipe sleeves under asphalt or vehicular traffic paving shall have 4 inches of surrounding backfill material.
- F. Restore surfaces, existing underground installations, etc., damaged or cut as a result of excavations, to original conditions in a manner approved by the Architect.
- G. Where other utilities interfere with irrigation trenching and pipe work, adjust the trench depth as instructed by Architect.
- H. All Irrigation piping shall have a minimum clearance of 4 inches from other irrigation piping and the piping of other trades, or minimum of 6 inches as may be required by city or state agency. Refer to city or state agency requirements. Pipelines routed parallel shall not be installed directly over one another.

3.5 SLEEVING

- A. Extend sleeve ends a minimum of 12 inches beyond the edge of the paved surface. Cover pipe ends and mark with stakes. Route wire through and tie at each end to stakes.
- B. Where pipes or control wires pass through sleeves, provide a removable non-decaying plug at ends of sleeve to prevent entrance of earth.
- C. Contractor must provide and install sleeving for all pipe and control wiring under paving even if plans do not indicate specific locations for clarity. Sleeve shall be twice the size of pipe carried.

3.6 ASSEMBLING PVC PIPELINES

- A. All pipes shall be assembled free from dirt and pipe scale. Field cut ends shall be reamed only to full pipe diameter with rough edges and burrs removed.
- B. Solvent Weld Joint:
 - 1. Prepare joint by first making sure the pipe end is square, then deburring the pipe end and cleaning the pipe and fitting of dirt.
 - 2. Dry-insert pipe into fitting to check for mis-sizing. Pipe should enter fitting 1/3 to 2/3 depth of socket.

3. Coat the inside socket surface of the fitting and the external surface of the male end of the pipe with P-70 primer (manufactured by Weld-On), immediately followed by Weld-On 711 cement liberally applied to the male end of the pipe and lightly applied to the inside of the socket. Then, apply a second coat of cement to the pipe end.
4. Insert pipe immediately into fitting and turn it 90° to distribute cement and remove air bubbles. The pipe must seat to the bottom of the socket and fitting. Check alignment of the fitting. Pipe and fitting shall be aligned properly without strain to either.
5. Hold joint still for approximately thirty (30) seconds and then wipe the excess cement from the pipe and fitting.
6. It is very important to wipe all excess cement from the pipe and fitting. Excess cement allowed to stay in contact with pipe and fitting will weaken pipe integrity.
7. Cure joint a minimum of thirty (30) minutes before handling and at least six (6) hours before allowing water in the pipe.

C. Threaded Joint:

1. Field threading of plastic pipe or fittings is not permitted. Factory-formed threads only will be permitted.
 2. Factory-made nipples shall be used wherever possible. Field-cut threads in metallic pipe will be permitted only where necessary. When field threading, cut threads accurately on the axis with sharp dies.
 3. All threaded joints shall be made up with pipe joint compound. Apply compound to male threads only.
 4. Where assembling metallic pipe to metallic fitting or valve, no more than three (3) full threads shall show when joint is made up.
 5. Where assembling to threaded plastic fitting, take up joint no more than one full turn beyond hand tightening.
 6. Where assembling soft metal (brass or copper) or plastic pipe, use a strap type friction wrench only; do not use a metal-jawed wrench.
- D. Cap or plug openings as pipeline is assembled to prevent entrance of dirt or obstruction. Remove caps or plugs only when necessary to continue assembly.
- E. Where PVC pipe passes under paving, they shall pass through SCH 40 PVC sleeve twice the size of pipe carried. Layout work as accurately as possible in accordance with diagrammatic drawings.
- F. Where pipes or control wires pass through sleeves, provide a removable non-decaying plug (expanding foam) at ends of sleeve to prevent entrance of earth.
- G. Water Systems: Maintain 10-foot minimum horizontal separation from potable water piping. Where reclaimed and potable water pressure main line piping cross, the reclaimed water piping shall be installed below the potable water piping in a PVC Class 200 pipe sleeve which extends a minimum of 5 feet on either side of the potable water piping. Provide a minimum vertical clearance of 6 inches.

3.7 MAINLINE ISOLATION VALVES

- A. Install where shown on Drawings where practical.
- B. Locate valve box minimum 24-inches from to walk edges, buildings, or walls.
- C. Install in shrub or ground cover areas where possible.
- D. Install in a Rain Bird 12-inch (nominal) standard rectangular valve box, model VB-STD.

3.8 REMOTE CONTROL VALVES-WITHOUT FILTER ASSEMBLY

- A. Install where shown on Drawings and group together where practical. Limit one remote control valve per box with no exceptions.

- B. Locate valve boxes 12 inches from and perpendicular to sidewalk edges, buildings, walls and curbs. Provide 12 inches between valve boxes where valves are grouped together.
- C. Thoroughly flush mainline before installing the valve.
- D. Install in shrub or ground cover areas where possible.
- E. Label control line wire at each valve with a 2 1/4" x 2 3/4" polyurethane I.D. tag, indicating identification number of the valve (controller and station number). Attach a label to control wire.
- F. Install in a Rain Bird 12-inch (nominal) standard rectangular valve box, model VB-STD.

3.9 REMOTE CONTROL DRIP VALVE ASSEMBLIES

- A. Install where shown on Drawings and group together where practical. Limit one remote control valve assembly per box with no exceptions.
- B. Locate valve boxes 12 inches from and perpendicular to sidewalk edges, buildings and walls. Provide 12 inches between valve boxes where valves are grouped together.
- C. Thoroughly flush mainline before installing the valve.
- D. Install in shrub or ground cover areas where possible.
- E. Label control line wire at each valve with a 2 1/4" x 2 3/4" polyurethane I.D. tag, indicating identification number of the valve (controller and station number). Attach a label to control wire.
- F. Install assembly within two Rain Bird 20-inch (nominal) jumbo rectangular valve boxes, model VB-JMB. Lower box shall be inverted.

3.10 QUICK COUPLING VALVES

- A. Install quick coupling valves on double swing-joint assemblies of brass risers and fittings.
- B. Thoroughly flush mainline before installing the valve.
- C. Install 12-inch from hardscape areas.
- D. Install in a Rain Bird 10-inch round valve box, model VB-RND.

3.11 VALVE BOXES

- A. Install one valve box for each type of valve unless otherwise noted.
- B. Install zone valves boxes 12 inches from walk or header and 12 inches apart. Short side of rectangular boxes shall be parallel to walk or header. Install 2 inches above finish grade in groundcover areas and 1/2 inch above finish grade (sod ht.) in lawn areas.
- C. Install common bricks as shown and as required to keep box stable. Install gravel sump after compaction of all trenches.

3.12 SPRINKLER HEADS AND BUBBLERS

- A. Thoroughly flush lines before installing heads, drip tubing, or bubblers.

- B. Locate heads and bubblers as shown in the drawings and details.
- C. Set sprinkler heads perpendicular to grade unless otherwise shown.
- D. Adjust sprinkler heads for proper distribution and trim, providing complete coverage with minimal overspray.

3.13 POINT SOURCE DRIP IRRIGATION

- A. Install per irrigation details.
- B. Install flush valve(s) at a point farthest away from source along header(s). Install in Rain Bird 7-inch round valve box, model VB-7RND.

3.14 DECODER CABLE SYSTEM GROUNDING

- A. The controller shall be grounded to meet the minimum manufacturer's specification for Controller Grounding. The contractor shall be responsible for proper grounding techniques as it relates to this project installation. All grounding of the irrigation control system shall be per Electrical Code.
- B. All grounding of the irrigation control system shall be per the American Society of Irrigation Consultants; ASIC Guideline 100-2002 For Earth Grounding Electronic Equipment in Irrigation Systems. Contractor shall have said guideline available for review on the job site at all times by the Landscape Architect / Irrigation Consultant and College's Authorized Representative. Contact ASIC www.asic.com (312) 372-7090 for information on obtaining this document.
- C. Ground kit shall be provided by SiteOne Green Tech, model GRPA. The grounding circuit requires a ground rod and a ground plate (U.L. approved 5/8"x8' copper-clad steel ground rod and a U.L. approved 4"x96" copper ground plate) plus a minimum of 50 pounds of PowerSet® earth contact material.
- D. The controller unit(s) shall:
 - 1. Install the grounding cable and earth ground hardware at right angles to the two-wire path(s).
 - 2. Locate ground rods and ground plates no more than 12-15 feet from the controller.
 - 3. Separate ground rods and ground plates outside the "Sphere of Influence" zone, which is the minimum of 10 feet apart.
 - 4. Ensure that no additional cable or control wires are within the same 10 foot "Sphere of Influence" zone.
 - 5. Ground cable shall be no smaller than AWG #6. The sweep from the controller for the grounding cable will be no smaller than 1-1/2".
 - 6. Place the ground rod in a separate 10-inch round valve box to facilitate maintenance.
 - 7. Make connections with CadWeld®. No other connections shall be approved.
 - 8. Ground controller through building ground system.
- E. Decoders:
 - 1. Grounding shall occur at every 12th decoder or 450' to 500 ft. of wire, whichever comes first.
 - 2. Grounding shall occur at the last decoder in any wire run.
 - 3. Grounding plate shall be installed perpendicular to the wire path and NOT pointing towards another decoder or wire path to ensure that the lightning's energy leaving the plate does not transfer to other parts of the system.
 - 4. Make connections with CadWeld®. No other connections shall be approved.
- F. Splices shall be made with 3M DBR/Y-6 / SPEARS DS-400 connectors, or as required by decoder manufacturer.

3.15 2- WIRE DECODER CABLE GROUNDING

A. Connections to Grounding Rods and Plates.

1. The minimum ground conductor running from the grounding device to the surge arrester shall be a minimum of a 6-gauge/4.0mm diameter, bare copper wire.
2. The ground rod must be buried a minimum of 6 inches under the soil.
3. All connections to grounding rods or ground plates shall conform to ASIC Earth Grounding Electronic Equipment in Irrigation Systems-Guidelines and shall consist of CADWELD™ connections. No other connections shall be approved.
4. The resistance reading at the grounding rod/plate connector shall be less than 1 milliohm.
5. Any wire extensions required to connect from a grounding rod or plate to a surge arrester or enclosure ground lug shall be bare copper.
6. The 6-gauge solid conductor shall not exceed a minimum of an 8-inch radius bend at any point along the wire.
7. There shall only be one mechanical connection on the grounding system.
8. All mechanical connections where wires connect shall be cleaned, scored, and covered with antioxidant.
9. Wire extensions connected to grounding devices shall use an exothermic weld CADWELD™ connection. Ground hardware shall extend at right angles from the two-wire path.

B. Surge Arrester Wiring and Installation.

1. The surge arrester shall be installed in an appropriate irrigation box and shall be connected to the two-wire in accordance with the manufacturer's two-wire connector specifications.
2. The surge arrester ground wire shall be connected to a bare copper solid core ground wire using a screw clamp or split bolt type connector (no wire nuts of any kind are supported for grounding wires). The connector shall be installed and insulated according to the manufacturer's specifications.
3. The bare copper wire shall be connected to the grounding device using the grounding device specifications.
4. The first surge arrester on the two-wire path shall be within 25' of the controller.
 - a. This grounding point shall be separate from the irrigation controller's enclosure grounding point.
5. A surge arrester shall be placed every 450'-500' on the two-wire path.
 - a. In lightning prone regions, A surge arrester shall be placed every 300' rather than going out to the maximum distance.
6. A surge arrester shall be placed at the end of the two-wire that is the maximum distance from the controller or if looped at the point of maximum distance from the controller.
7. Any branch of the two-wire that exceeds 50' shall have a surge arrester at the end.
8. On an uninterrupted wire run of more than 500', a surge arrester shall be placed at each end.

C. Splices shall be made with SPEARS DS-400 connectors.

3.16 BACKFILLING

- A. Backfill only after piping has been tested, inspected and approved.
- B. Backfill material shall be the earth excavated from the trenches, free from rocks, concrete chunks, and other foreign or coarse materials. Carefully select backfill that is to be placed next to plastic pipe to avoid any sharp objects which may damage the pipe.
- C. All mainline pipe 3" and larger and/or below vehicular traffic lanes shall have 4 inches of surrounding backfill material, consisting of clean sand, on all sides of pipe.

- D. Place backfill materials in 6-inch layers and compact by tamping to a minimum compaction of 90 percent relative compaction per ASTM D1557.
- E. All pipe sleeve under asphalt or vehicular traffic paving shall have 4 inches of surrounding backfill material, consisting of clean sand, on all sides of pipe.
- F. Trenches located under areas where asphaltic concrete or concrete paving occur, shall be backfilled with sand (a layer 4 inches below the pipe and 4 inches above the pipe) and compacted in layers to 95% relative compaction per ASTM D1557, using manual or mechanical tamping devices. Trenches for piping shall be compacted to equal the compaction of the existing adjacent undisturbed soil and shall be left in a firm unyielding condition. All trenches shall be left flush with adjoining finish grade. The Contractor shall set in place, cap and pressure test all piping under paving prior to the paving work.
- G. Generally, piping under existing walks is done by jacking, boring or hydraulic driving, but where any cutting or breaking of concrete is necessary, it shall be done and replaced by the Contractor at no cost to the College. Permission to cut or break concrete shall be obtained from the College's Authorized Representative. No hydraulic driving will be permitted under concrete paving.
- H. Dress off areas to finish grades and remove excess soil, rocks or debris remaining after backfill is completed.
- I. If settlement occurs along trenches, and adjustments in pipes, valves and sprinkler heads, soil, sod or paving are necessary to bring the system, soil, sod, or paving to the proper level or the permanent grade, Contractor, as part of the work under this Contract, shall make all adjustments without extra cost to the College.

3.17 TEMPORARY REPAIRS

- A. The College reserves the right to make temporary repairs as necessary to keep the irrigation system in operating condition. The exercise of this right by the College shall not relieve the Contractor of his responsibilities under the terms of the Guarantee as herein specified.

3.18 PIPE TESTS

- A. Notify Architect at least three (3) days in advance of testing.
- B. Perform testing at Contractor's own expense.
- C. Center load piping with a small amount of backfill to prevent arching or slipping under pressure. No fitting shall be covered.
- D. Apply the following tests after all weld plastic pipe joints have cured at least 24 hours.
 - 1. Test live (constant pressure) and quick coupling valve lines WITHOUT equipment requiring attachment to the mainline hydrostatically at 125 PSI minimum. Lines shall be filled with water and pressure gauge connected to the pipeline. After lines have reached the 125 PSI, (use hydraulic pump or other safe method - do not use an air compressor) cut off the source of pressure. Lines will be approved when test pressure (with an allowable drop of 2 PSI) is maintained for a minimum of two (2) hours. Should leaks develop during the test period, they shall be located and repaired and retested in the same method. The Contractor shall make tests and repairs as necessary until test conditions are met.

2. At completion, test live (constant pressure) and quick coupling valve lines WITH ball valves, RCV's, QCV's, and other equipment requiring attachment to the mainline hydrostatically at 125 PSI minimum. Lines shall be filled with water and pressure gauge connected to the pipeline. After lines have reached the 125 PSI, (use hydraulic pump or other safe method - do not use an air compressor) cut off the source of pressure. Lines will be approved when test pressure (with an allowable drop of 4 PSI) is maintained for a minimum of two (2) hours. Should leaks develop during the test period, they shall be located and repaired and retested in the same method. The Contractor shall make tests and repairs as necessary until test conditions are met.
 3. Test lateral lines with water at line pressure and visually inspect for leaks. Retest after correcting defects.
- E. Remake faulty joints with new materials. Do not use cement or caulking to seal leaks.

3.19 SYSTEM ADJUSTMENT

- A. Adjust RCV pressure regulating modules to proper and similar pressure to provide optimum and efficient coverage.
- B. Adjust nozzle sizes, degree of arc, change out nozzles, and install pressure compensating screens as required to cover planting areas without overspray at Contractor's expense. Adjust all sprinklers to keep spray in confines of planted area. No overspray shall be allowed onto paving, buildings, or walls.
- C. Drip System Check
 1. Immediately after installation, flush lateral line piping by removing automatic flush valve, figure 8 fitting, or by opening the manual shut-off flush valve.
 2. Clean filter. Open filter flush valve for at least 10 seconds. Clean or replace clogged elements.
 3. For adjustable pressure regulators adjust pressure regulator to system design pressure.
 4. Verify that emitters are producing specified water output. If not, replace emitters, check filter element, check pressure at emitters, and review system for clogs and leaks. Correct deficiencies.
- D. Overhead Irrigation and Bubbler Check
 1. Perform coverage test in the presence of Architect to establish that coverage of all planting areas is complete and adequate.
 2. Correct deficiencies and repeat test until approved.

3.20 GUARANTEE

- A. It shall be the responsibility of the Contractor to fill and repair all depressions and replace all necessary lawn and planting due to the settlement of irrigation trenches for one year following completion and acceptance of the job.
- B. The Contractor shall also guarantee all materials, equipment and workmanship furnished by him to be free of all defects of workmanship and materials, and shall agree to replace at his expense, at any time within one year after installation is accepted, any and all defective parts that may be found.

3.21 SITE DAMAGE

- A. Repair scars, ruts, or other marks in landscaped areas caused by Irrigation Contractor.
- B. Repair all scars, gouges, and any otherwise damage to streets, sidewalks, walls, and any other hardscape or paved surfaces which are caused by Irrigation Contractor's operations, equipment, or personnel. All repairs shall be done in a manner as to return said repairs to original condition and to the Landscape Architect's and/or College's Authorized Representative's satisfaction.

3.22 CLEANUP

- A. When work of this section has been completed, and at such other times as may be directed, remove all trash, debris, surplus materials, and equipment from the site.
- B. Upon completion of work, remove from site machinery, tools, excess materials, and rubbish resulting from Contractor's operations.
- C. Clean and remove all tire marks left on paved surfaces by equipment used in Contractor operations and as directed by the Landscape Architect and/or College's Authorized Representative.
- D. Leave work areas in a neat and clean condition as accepted by the Landscape Architect and/or College's Authorized Representative. Sweep clean all paved areas.

3.23 PRE-MAINTENANCE OBSERVATION (PUNCH LIST)

- A. Irrigation Consultant shall conduct a 'Pre-Maintenance Period Walk-Through' walk with Contractor foreman and Contractor project supervisor for the purpose of observing irrigation system. The contractor shall operate each system in its entirety for the College's Authorized Representative at this time. Items deemed unacceptable by the Irrigation Consultant and/or College's Authorized Representative shall be reworked to College satisfaction.
- B. The Contractor shall provide a Controller Chart and "As-built" Drawings to the Landscape Architect 3 DAYS before the 'Pre-Maintenance Period Walk-Through' walk occurs.
- C. Irrigation Consultant may call off walk-through at their discretion if/when contractor representative is/are not available for the walk-through. The contractor shall reimburse Consultant for all travel expenses.
- D. Consultant shall provide a 'Punch List Field Report' showing items of concern and those requiring rework.

3.24 FINAL OBSERVATION PRIOR TO ACCEPTANCE

- A. The Contractor shall provide and show proof of completed punch list report before Final Walk-Through. During walk-through items deemed not acceptable by the Irrigation Consultant and/or College's Authorized Representative, shall be reworked to the College's satisfaction.
- B. Before the Final 'Walk-Through' will be conducted the Contractor shall show evidence to the College's Authorized Representative that the College has received all accessories, charts, "As-Built" Drawings, and equipment as shown in the Drawings and Specifications. May be part of the O&M Manual.
- C. Five days prior to the Final 'Walk-Through' the Contractor shall deliver the Operations and Maintenance Manual and all other submittal items to the Landscape Architect and the College's Authorized Representative for review and acceptance.
- D. Project maintenance period shall not start until the Landscape Architect accepts with approval of the complete irrigation system.

3.25 SITE VISIT OBSERVATION SCHEDULE

- A. Site visits are required for the project. Site Visits shall be conducted concurrently with the main project adjacent to this project. Refer to the Specifications for the main project adjacent to this project for the site visit schedule. The Contractor shall be responsible for notifying the Landscape Architect and the College's Authorized Representative in advance of site visits.

- B. When site visits are conducted by someone authorized other than the Irrigation Consultant or College's Authorized Representative, the Contractor shall show evidence in writing and applicable photos of site visit, and documentation of when and by whom these site visits were made.
- C. No site visits will commence without current "As-Built" Drawings.

END OF SECTION 328400

SECTION 329000 - PLANTING

PART 1 - GENERAL

1.1 DESCRIPTION

- A. Provide planting work and planting maintenance complete as shown on the drawings and as specified including staking and layout of the landscaping, including soil sampling as required by the State of California Model Water Ordinance.
- B. Related work specified elsewhere includes:
 - 1. Section 312200, EARTHWORK AND GRADING
 - 2. Section 328400, PLANTING IRRIGATION

1.2 QUALITY ASSURANCE

- A. Reference Standards:
 - 1. All local, municipal and state laws, codes and regulations relating to all portions of this work are to be incorporated as part of these Specifications. These specifications shall not be construed to conflict with any of the above codes, regulations or requirements. The Specifications and Drawings shall take precedence when they call for materials, workmanship or construction of a better quality or higher standard than required by the above mentioned codes and regulations. Furnish without extra charge additional materials and labor required to comply with above rules and regulations.
 - 2. State of California Model Water Ordinance
 - 3. Public utility agency having jurisdiction over the project work.
 - 4. "Sunset Western Garden Book," Lane Publishing Co., Menlo Park, California; current edition.
 - 5. "American Standards for Nursery Stock," American Association of Nurseryman, 230 Southern Building, Washington, D.C. 20005.
 - 6. International Society of Arboriculture, Guide for Plant Appraisal, latest version.
 - 7. US Composting Council Compost Analysis Program (CAP)
 - 8. US Composting Council (USCC) Seal of Testing Assurance (STA) program.
 - 9. Test Methods for the Evaluation of Composting and Compost (TMECC)
 - 10. Manufacturer's recommendations.
- B. Qualifications:
 - 1. Experience: Assign a full-time employee to the job as foreperson for the duration of the Contract who is certified landscape technician, certification through CLCA or minimum of four (4) years experience in landscape installation and maintenance supervision, with experience or training in turf management, entomology, pest control, soils, fertilizers and plant identification
 - 2. Labor Force: Provide a landscape installation and maintenance force thoroughly familiar with, and trained in, the work necessary to complete the tasks described herein in a competent, efficient manner acceptable to the District.
- C. Requirement
 - 1. Site Visit: At beginning of work, visit and walk the site with the District's Representative to clarify scope of work and understand existing project/site conditions.
 - 2. Supervision: The foreperson shall directly supervise the work force at all times and be present during the entire installation. Notify District's Representative of all changes in supervision.
 - 3. Identification: Provide proper identification at all times for landscape maintenance firm's vehicles and a labor force uniformly dressed in a manner satisfactory to District's Representative.
 - 4. Protect all existing and new plants from construction activities, deer & rodents: Contractor shall be responsible for protection of all planting per Part 3.
- D. Plant Material Standards:

1. Quality and Size of Plants: Conform to the State of California Grading Code of Nursery Stock, No. 1 grade. Use only nursery-grown stock which is free from insect pests and diseases.
2. Comply with federal and state laws requiring inspection for plant diseases and infestations. Submit inspection certificates required by law with each shipment of plants, and deliver certificates to the District. Obtain clearance from the County Agricultural Commissioner as required by law, before planting plants delivered from outside the County in which planted.

E. Soils & Amendment Testing

1. All soils & amendments to be tested for agricultural suitability by one of the following accredited soil testing laboratories (or approved equal). Components of the test shall include all major nutrients, pH, salinity, boron, sodium, micronutrients, copper, zinc, manganese and iron, adsorption rate, organic content and texture. The laboratory report shall include recommendations for adjusting fertilizer and amendment quantities.

Waypoint Analytical, Inc.
4741 E. Hunter Ave, Suite A, Anaheim, CA 92807; (717) 282-8777

Control Laboratories
42 Hangar Way, Watsonville, CA 95076; (831) 724-5422
Perry Laboratory
424 Airport Boulevard , Watsonville, CA 95076; (831) 722-7606

Wallace Laboratories, LLC
365 Coral Circle, El Segundo, CA 02345; (310) 615-0016

- F. Upon approval of the laboratory's report by the Landscape Architect, the recommendations in the report shall become a part of the Specifications and the soil preparation procedures, quantities of soil amendment, fertilizer and other additives shall be adjusted to conform with the report at no additional cost to the owner. Note that there is a minimum quantity of organic amendment specified elsewhere in this specification section.
- G. Significant issues with soil quality will require soil to be retested in the locations identified on Soil Analysis Plan, prior to proceeding with plant installation, to ensure that the recommendations in the report have been followed and the In-Situ Topsoil is agriculturally suitable as described in Part 2.

1.3 DEFINITIONS

- A. Subsoil: Soil beneath the level of subgrade; soil beneath the topsoil layers of a naturally occurring soil profile, typified by less than 1 percent organic matter and few soil organisms. Subsoil is defined as either existing site soil located below the topsoil prior to construction activities, or select fill used for rough grading during construction. Subsoil cannot be considered for use as planting soil.
- B. Surface Soil: Soil that is present at the top layer of the existing soil profile. In undisturbed areas, surface soil is typically called "topsoil," but in disturbed areas such as urban environments, the surface soil can be subsoil.
- C. Topsoil: Top layer of the soil profile consisting of existing native surface topsoil or existing in-place surface soil; the zone where plant roots grow.
- D. Topsoil: Top layer of the soil profile consisting of existing native surface topsoil or existing in-place surface soil; the zone where plant roots grow. Its appearance is generally friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil, clay lumps, gravel, and other objects larger than 2 inches in diameter; and free of weeds, roots, toxic materials, or other non-soil materials.

- E. Planting Soil: Approved existing topsoil or imported planting soil, meeting the requirements herein. Subsoil cannot be considered for use as planting soil.

1.4 SUBMITTALS, per Section 013300.

- A. The following shall be submitted to the landscape architect for approval prior to the installation of landscape materials and products.
 - 1. Manufacturer's Technical data sheets for fertilizers, turf, and all other products and materials listed herein.
 - 2. Manufacturer's technical data sheets for amendments. Reports to be dated no more than 3 months prior to soil preparation.
 - 3. 1-pint samples of imported soils, organic amendments/compost, mulches, and stones.
- B. Submit planting soil and organic amendment laboratory reports a minimum of [3] weeks prior to beginning soil prep. See below for required soil analysis reports.
- C. Required Soil Analysis Reports. Reports to be dated no more than [3] months prior to soil preparation.
 - 1. Soil Analysis Plan: Contractor to submit annotated plan showing confirmed locations of all required soil tests. Each location is to be identified with a unique label.
 - 2. Existing Planting Soil Analysis: After approval of the Soil Analysis Plan, rough grading, and topsoil placement, contractor to obtain 3 representative samples of in situ topsoil taken from approved site locations at depth of 4" to 6" below finish grade and submit to an accredited soils testing laboratory for "agricultural suitability" analysis, including particle size, infiltration rate, and evaluation of physical and chemical properties of soil and recommendations for adding amendments and fertilizers to the soil.
 - 3. Subsoil Analysis: In addition to the above required soil samples, contractor to obtain one representative sample of any subgrade soil that is to receive a layer of imported planting soil over it. The laboratory report shall include the soil's infiltration rate, total combined silt and clay content for determining the total allowable combined silt and clay content of the imported planting soil specified herein.
 - 4. Imported Planting Soil Analysis: Contractor to submit an "agricultural suitability" analysis report from an accredited soils testing laboratory, including particle size, infiltration rate, and evaluation of physical and chemical properties of soil and recommendations for adding amendments and fertilizers to the soil. Soil to conform to requirements in Part 2.
 - 5. Amended Planting Soil Analysis: Significant issues with soil quality will require soil to be retested in the locations identified on Soil Analysis Plan, prior to proceeding with plant installation, to ensure that the recommendations in the report have been followed and the final Planting Soil is agriculturally suitable as described in Part 2.
- D. The Contractor is responsible to follow all local water ordinances and make available to the local agency the soil analysis report and verification of its implementation as required.
- E. Delivery Receipts upon request by District, provide delivery receipts for quantities of soil & amendments delivered to the site.
- F. Plant sample of each variety of plant. Samples to be delivered to the site 2 weeks prior to plant installation and stored and maintained separately from entire quantity of delivered plants. Contractor to maintain plants throughout maintenance period. Plants to be reviewed in a single site visit.
- G. Representative photos of each plant species. Photos to be of plants to be delivered to site and not a stock photograph.
- H. Entire plant quantity delivered to the site. Plants to be reviewed prior to installation during a single site visit.

- I. Representative photos of each tree species (unless trees previously tagged at nursery by landscape architect). Photos to be of trees to be delivered to site and not a stock photograph.

1.5 WARRANTY AND REPLACEMENT

- A. Maintenance Period: See Part 3.
- B. Warrant the work against weed growth for a period of four (12) months after application of Pre-Emergence Weed Killer.
- C. Warrant all plants to be in a healthy, thriving condition until the end of the maintenance period, and deciduous trees, shrubs and vines beyond that time until active growth is evident.
- D. Replace all dead and damaged plants and plants not in a vigorous condition immediately upon discovery and as directed by the District's Representative and at no cost to the owner. Install replacement plants before the final acceptance of the maintenance period in the size specified.
- E. Warrant all products, prepared soils and plant material installed and maintained by contractor against defects for a period of one year after final acceptance of the maintenance period.

PART 2 - PRODUCTS

2.1 SUBSOIL

- A. Submit soil analysis report from an approved soil/s laboratory for approval by the Landscape Architect. Refer to Part 1 for soil testing requirements.

2.2 EXISTING PLANTING SOIL (ON-GRADE):

- A. Existing Planting Soil is defined as on-site topsoil that is either to be removed and stockpiled for reuse or to remain in place during construction. Satisfactory planting soil shall be free of subsoil, clay, lumps, stones, and other objects over 4" in diameter, and without weeds, roots, and other objectionable material. The soil shall be fertile, friable, natural, productive soil containing a normal amount of humus, and shall be capable of sustaining healthy plant life. Soil shall not be infested with nematodes or with other noxious animal life or toxic substances. Soil shall be obtained from well-drained, arable land, and shall be of an even texture. Soil shall not be taken from areas on which are growing any noxious weeds such as morning glory, equisetum, or Bermuda grass, etc.
- B. If herbicide contamination is suspected then a radish/ryegrass growth trial must be performed. Consult with Landscape Architect prior to decision to test or not.
- C. Amended Planting Soils are to conform with the following target levels. Elements are expressed as mg/kg dry soil or mg/l for saturation extract.

pH value	6.5-7.9,	iron	4-15 mg/kg
lime	none present	manganese	0.6-3.0 mg/kg
salinity (ECe)	0.5-3 milli-mho/cm	zinc	1-3 mg/kg
chloride	<150 ppm	copper	0.2-3.0 mg/kg
nitrate	20-30 ppm	boron	0.2-0.5 mg/kg
SAR	<3	magnesium	25-100 mg/kg
phosphorus	8-20 mg/kg	sodium	<200 mg/kg
potassium	60-180 mg/kg	sulfur	25-100 mg/kg

- D. If sufficient on-site surface topsoil is not available, contractor to provide imported planting soil as specified below. Placement of dissimilar soils shall be coordinated with irrigation zones by the contractor to maintain separate valves for dissimilar soils.
- E. Submit soil analysis report from an approved soils laboratory for approval by the Landscape Architect. Refer to Part 1 for soil testing requirements.

2.3 IMPORTED PLANTING SOIL (ON-GRADE):

- A. Imported planting soil shall be screened and shall be free of subsoil, heavy or stiff clay, rocks, gravel, brush, roots, weeds, noxious seeds, sticks, trash, and other deleterious substances.
- B. Imported Planting Soils are to conform with the following target levels. Elements are expressed as mg/kg dry soil or mg/l for saturation extract.

pH value	6.5-7.9,	iron	4-15 mg/kg
lime	none present	manganese	0.6-3.0 mg/kg
salinity (ECe)	0.5-3 milli-mho/cm	zinc	1-3 mg/kg
chloride	<150 ppm	copper	0.2-3.0 mg/kg
nitrate	20-30 ppm	boron	0.2-0.5 mg/kg
SAR	<3	magnesium	25-100 mg/kg
phosphorus	8-20 mg/kg	sodium	<200 mg/kg
potassium	60-180 mg/kg	sulfur	25-100 mg/kg

- C. The silt and clay content of Imported Planting Soil shall not exceed that of the existing soil it is to be placed over. Except where otherwise required, it shall be a "Sandy Loam" as classified in accordance with USDA Standards with a combined total of between 25% to 40% Clay and Silt.
- D. Submit soil analysis report from an approved soils laboratory for approval by the Landscape Architect. Refer to Part 1 for soil testing requirements.
- E. Following approval of the sample, provide a one-half cubic yard sample, which shall be stored at the site of work for comparison with sample and subsequent loads of soil. The comparison sample shall be protected by a cover until the installation of all soil has been completed and accepted.

2.4 PLANTING SOIL FOR STORMWATER TREATMENT

- A. Planting soil for stormwater treatment shall be used in landscape areas designed for infiltration and the filtration of stormwater runoff before entering the storm drain system as specified below and as shown in drawings.
- B. Planting soil mixes for stormwater treatment are available from TMT Enterprises in San Jose, CA, (408-432-9040); American Soil and Stone in Richmond, CA (510-292-3000) and San Rafael, CA (415-456-1381); and Lyngso Garden Materials in Redwood City, CA, (650-364-1730); or approved equal.
- C. Planting soil for stormwater treatment shall conform to the following:
 1. All material shall be free of trash and debris, expansive clays or any other deleterious materials
 2. Material shall be free of seeds.
 3. The mineral component shall be classified as USDA sand or loamy sand and shall conform to the following particle size and characteristics.

US Sieve	Size (mm)	Class	% wt. retained
----------	-----------	-------	----------------

#10	2.0	Gravel	0-10
#35	2.0-0.5	coarse sand 20-35	
#270	<0.05	Silt & Clay	6-12

Rock ½ inch – 1 inch = 0-5% by volume with none > 1 inch
 Organic = 0-3% by weight

4. Percolation Rate must fall in the range of 10 inches per hour Initial Rate and 5 inches Sustained Rate as determined by SPL method A06-2, unless otherwise specified by civil engineer.
5. Chemistry Suitability Considerations
 - a. Salinity: Saturation Extract Conductivity (ECe) Less than 3.0 dS/m @ 25° C.
 Sodium: Sodium Adsorption Ratio (SAR) Less than 6.0
 Boron: Saturation Extract Concentration Less than 1.0 ppm
 Reaction: pH of Saturated Paste: 5.5 – 7.8 without high lime content.
 - b. Top 6" should be amended with the approved organic composted yard waste. See Part 3 for amendment procedures.
- D. Submit Soil analysis report(s) for approval by the Landscape Architect and Civil Engineer. Refer to Part 1 for soil testing requirements.
 1. Submit soil analysis report (including infiltration rate) for planting soil mix for stormwater treatment from an approved soils laboratory.
 2. Submit subsoil analysis report (including infiltration rate) for subsoils if planting area is designed to allow stormwater to infiltrate into native subsoils.

2.5 ORGANIC AMENDMENT FOR PLANTING SOILS (ON-GRADE):

- A. Ground Redwood or Ground Fir Bark with the following properties:

Percent Passing Sieve	Designation
100	9.51 mm 3/8"
50-60	6.35 mm 1/4"
20-40	4.76 mm No. 4
0-20	2.38 mm No. 8 8 mesh

Redwood Sawdust

Dry bulk density, lbs. per cu. yd.	260-280
Nitrogen stabilized - dry weight basis	0.4% minimum
Salinity (ECe):	4.0 maximum
Organic Content:	90% minimum
Reaction (pH):	4.0 minimum

Ground Fir and/or Pine Bark

Dry bulk density, lbs. per cu. yd.	350 minimum
Nitrogen stabilized - dry weight basis,	0.5% minimum
Salinity (ECe):	4.0 maximum
Organic Content:	90% minimum
Reaction (pH):	4.0 minimum

- B. **Submit sample, product's technical data sheet, and analysis report** from an approved soils laboratory for approval by the Landscape Architect. The analysis report should include compliance to the specifications above and directions for product use.
- C. Contractor may use Composted Yard Waste Amendment in lieu of the above specified Organic Amendment pending approval of product' technical data sheet.

2.6 COMPOSTED YARD WASTE AMENDMENT FOR PLANTING SOILS (ON-GRADE):

- A. The above ORGANIC AMENDMENT FOR PLANTING SOILS (ON-GRADE) is the specified organic amendment material. Acceptance of Composted Yard Waste Amendment in lieu of the above specified amendment material will be considered if the in situ planting soil salinity and soil structure is favorable for the inclusion of recycled yard waste organic matter, as approved by the Landscape Architect.
- B. Composted yard waste amendment **will not** be accepted for use in on-structure raised planters and pots.
- C. The composted yard waste amendment shall be a mixture of feedstock materials including green material consisting of chipped, shredded, or ground vegetation and mixed food waste, or clean processed recycled wood products. Single source, biosolids (sewage waste) compost will not be acceptable.
- D. The addition of the compost shall result in a final ECe of the amended soil of less than 4.0 dS/m @ 25 degrees C. as determined in a saturation extract. Use the following table to determine the maximum allowable Ece (dS/m of saturation extract) of compost at desired use rate and allowable Ece increase.

DESIRED USE RATE		MAXIMUM ALLOWABLE Ece INCREASE FROM AMENDMENT		
Cu. Yds. Amendment Per 1000 Sq. Ft. for Incorporation to 6" depth	Volume percentage of amendment	1 dS/m	2 dS/m	3 dS/m
		Maximum ECe of Compost		
1	5	14	28	42
2	11	7	14	21
3	16	5	9.5	14
4	22	3.5	7	10.5
5	27	3	5.5	8.5
6	32	2.5	4.5	7

Example: Specification calls for 6 cu. Yrds. Compost per 1000 sq. ft. for incorporation to 6" depth, and site soil has an ECe of 2.0. In order to avoid exceeding ECe of 4 in final blend, compost ECe shall be less than 4.5 dS/m.

- E. Composted Yard Waste Soil Amendment properties to conform to the following:
 1. Gradation:

% Passing by weight	Sieve Designation
85-100	9.51 mm
50-80	2.38 mm
0-40	500 micron
 2. Organic Content: Minimum 50% based on dry weight and determined by ash method. Minimum 250 lbs. organic matter per cubic yard of compost.
 3. Carbon to nitrogen ratio: Maximum 35:1 if material is claimed to be nitrogen stabilized.
 4. pH: 5.5 – 8.0 as determined in saturated paste.
 5. Soluble Salts: See D. above.
 6. Moisture Content: 35-60%.
 7. Contaminants: The compost shall be free of contaminants such as glass, metal and visible plastic. Heavy meals, fecal coliform and Salmonella shall not exceed levels outlined as acceptable in the California integrated waste management regulations.
 8. Maturity: Physical characteristics suggestive of maturity include:
 - Color: Dark brown to black.
 - Acceptable Odor: None, soil-like, or musty.
 - Unacceptable Odor: Sour, ammonia or putrid.
 - Particle Characterization: Identifiable wood pieces are acceptable, but the balance of the material shall be soil-like without recognizable grass or leaves.

- F. Submit sample, product's technical data sheet, and analysis report from an approved soils laboratory for approval by the Landscape Architect. The analysis report should include compliance to the specifications above, directions for product use, and a list of ingredients. It is the Contractor's responsibility to secure test of the proposed composted yard waste amendment (2 quart sample) and submit to a Soils Laboratory for evaluation and recommendations. The composted yard waste amendment sample shall be a grab sample from the currently available material that has been tested within the last 30 days and shall include the composter's Compost Technical Data Sheet that includes lab analytical test results and directions for product use along with list of ingredients. Refer to Part 1 for soil testing requirements.
- G. Based on the Soils Laboratory evaluation, the addition of composted yard waste amendment **shall not be** acceptable if it creates a leaching requirement.

2.7 PLANTS

- A. Plant the variety, quantity and size indicated on drawings. The total quantities indicated on the drawings are considered approximate and furnished for convenience only. Contractor shall perform plant quantity calculations and provide all plants shown on the drawings.
- B. Measure trees and shrubs with branches in normal position. Height and spread dimensions indicated refer to the main body of the plant, and not from branch tip to tip.
- C. Take precautions to ensure that the plants will arrive at the site in proper condition for successful growth. Protect plants in transit from windburn and sunburn. Protect and maintain plants on site by proper storage and watering.
- D. Install healthy, shapely and well rooted plants with no evidence of having been root-bound, restricted or deformed.
- E. Tag plants of the type or name indicated and in accordance with the standard practice recommended by the American Association of Nurserymen.
- F. Substitutions will not be permitted, except as follows:
 - 1. If proof is submitted to the Landscape Architect that any plant specified is not obtainable, a proposal will be considered for use of nearest equivalent size or variety with an equitable adjustment of contract price.
 - 2. Substantiate and submit proof of plant availability in writing to the Landscape Architect within 10 days after the effective date of Notice to Proceed.
- G. Tree Form
 - 1. Trees shall have a symmetrical form as typical for the species/cultivar and growth form.
 - 2. Central Leader for Single Trunk Trees: Trees shall have a single, relatively straight central leader and tapered trunk, free of co-dominant stems and vigorous, upright branches that compete with the central leader. Preferably, the central leader should not have been headed; however, in cases where the original leader has been removed, an upright branch at least ½ the diameter of the original leader just below the pruning point shall be present.
 - 3. Potential Main Branches: Branches shall be evenly distributed radially around and appropriately spaced vertically along the trunk, forming a generally symmetrical crown typical for the species.
 - 4. Headed temporary branches should be distributed around and along the trunk as noted above and shall be no greater than 3/8" diameter, and no greater than ½ diameter of the trunk at point of attachment.
- H. Tree Trunk
 - 1. Trunk diameter and taper shall be sufficient so that the tree will remain vertical without the support of a nursery stake.
 - 2. Trunk shall be free of wounds (except properly-made pruning cuts), sunburned areas, conks (fungal fruiting-bodies), wood cracks, bleeding areas, signs of boring insects, galls, cankers and/or lesions.

3. Tree trunk diameter at 6" above the soil surface shall be within the diameter range shown for each container size below, except where shown otherwise:

Container	Trunk Diameter	Soil level from Container Top
gallon	0.5" to 0.75"	1.25 to 2"
gallon	0.75" to 1.0"	1.75 to 2.75"
Box	1.5" to 2.5"	2.25 to 3"
Box	>2.5"	2.25 to 3"
Box	>2.5"	3-6"

4. Tree trunks shall be undamaged and uncut with all old abrasions and cuts completely callused over. Do not prune plants prior to delivery.

I. Tree Roots

1. Trunk root collar (root crown) and large roots shall be free of circling and/or kinked roots. Contractor may be required to remove soil near the root collar in order to verify that circling and/or kinked roots are not present.
2. The tree shall be well rooted in the container. When the trunk is lifted the trunk and root system shall move as one and the rootball shall remain intact.
3. The top-most roots or root collar shall be within 1" above or below the soil surface. The soil level in the container shall be within the limits shown in above table.
4. The rootball periphery shall be free of large circling and bottom-matted roots.
5. On grafted or budded trees, there shall be no suckers from the root stock.

2.8 TURF GRASS

- A. Turf Sod: Blends as follows:

Tall Fescue Sod Mix (Grown on Sand)
 90 to 95% Dwarf-type Fescue and Tall-type Fescue
 10% to 20% Blue Grass
 Available from Delta bluegrass (800) 637-8873

2.9 FERTILIZERS

- A. General Landscape Fertilizers:

1. Commercial fertilizer, pelleted or granular form, conform to the requirements of Chapter 7, Article 2, of the Agricultural Code of the State of California for fertilizing materials as follows:
 - a. Type A: 6% Nitrogen, 20% Phosphorus Acid and 20% Potash, (6-20-20)
 - b. Type B: 21 gram planting tablets 20% Nitrogen, 10% Phosphoric Acid and 5% Potash (20-10-5) available from Agriform or 10gm BestPacks packets 20% Nitrogen, 10% Phosphoric Acid and 5% Potash (20-10-5) available from Best Fertilizer Co.
 - c. Type C (Maintenance Fertilizer): Complete fertilizer 21% Nitrogen, 7% Phosphoric Acid and 14% Potash (21-7-14).

- B. If commercial fertilizer having the above analysis is not obtainable, other similar commercial fertilizer may be used providing it meets the approval of the Landscape Architect.

- C. Sod Fertilizer
 Provided by grower.

- D. Sod Fertilizer:
Provided by grower.

- E. Hydroseed Fertilizer
Hydroseed fertilizer to be used in the slurry shall be commercial fertilizers conforming to the requirements of the California Food and Agricultural Code, shall have a guaranteed analysis for nitrogen, phosphorus and potassium of 7-2-1. Products specified as slow release shall have been tested and demonstrate a nearly linear curve.

2.10 IRON SULFATE

- A. Dry form.

2.11 EROSION CONTROL NETTING

- A. New, with a uniform, open plain-weave, flame-retardant mesh. The mesh shall be [natural brown-tan] and made from unbleached single jute yarn. The yarn shall be of loosely twisted construction and shall not vary in thickness by more than one-half its normal diameter. Furnish jute mesh in rolled strips to meet the following requirements:
1. Width: 48 inches, with a tolerance of one-inch wider or narrower.
 2. Not less than 78 warp ends per width.
 3. Not less than 41 weft ends per yard.

2.12 PERFORATED DRAIN PIPE

- A. Polyvinyl Chloride (PVC) pipe and pipe fittings shall meet extra strength minimum of SDR-35 of the requirements of ASTM Specification D3034.
- B. Perforated and non-perforated corrugated polyethylene pipe, 3- to 10-inch diameter, shall meet the requirements of ASTM D883 and ASTM F412, and shall conform to Section 68 of the Standard Specifications.
- C. Corrugated polyethylene pipe fittings shall comply with all requirements of AASHTO M-252-851 for 3- to 10-inch diameter pipe. Couplings shall be split or snap-on type for perforated pipe and split couplings with gaskets for non-perforated pipe. Cutting pipe with integral couplings will not be allowed.
- D. Corrugated polyethylene pipe and fittings manufactured by Advanced Drainage Systems, Inc., shall be considered the standard to determine compliance to this specification.
- E. Inspection Tube Cap: Paint cap one coat chocolate-brown color using Flat, exterior grade latex paint as accepted by District's Representative.

2.13 FILTER FABRIC / PERMEABLE LANDSCAPE FABRIC

- A. Polyester or polypropylene non-woven filter fabric with uniform fiber distribution by "Terra Bond" #1115, "Mirafi, Inc." #140N, or approved equal.

2.14 PERMEABLE DRAIN ROCK

- A. Permeable drain rock used in subsurface drain installations to be Class 2 permeable material in conformance with Section 68 "Subsurface Drains" of the Standard Specifications; gradation to 3/4" maximum size. Submit Sample for approval.

2.15 ROOT BARRIER

- A. UB 18-2 as manufactured by Deep Root Corporation (800) 458-7668, Root Solutions, Inc. (800) 554-0914, or equal. Install a minimum of 6 panels/16 linear feet centered on each tree, where tree is within 8 feet of sidewalk, paving, or utilities.
- B. Geomembrane Root barrier at utilities: Bamboo Barrier Geomembrane as manufactured by Deepproot. Install per manufacturer's recommendation. Install a minimum of 15' centered on tree.
 - 1. Thickness: 0.060" For utilities within 5' of tree
 - 2. Thickness: 0.030"- 0.040" For utilities beyond 5' from tree

2.16 LANDSCAPE EDGING

- A. Metal Edge Restraints: Subject to conformance with requirements, available manufacturer that offer product that may be incorporated into the Work includes, but not limited to DuraEdge paving restraint edging for straight and curvilinear borders at planting areas, as manufactured by J.D. Russell Company, or equal, (800) 888-7425, www.jdrussellco.com.
 - 1. Comply with ASTM A1011, hot-rolled, standard flexible, carbon steel landscape edging, fabricated in sections with stake pockets stamped, punched or welded to face of section approximately 30 inches apart to receive stakes.
 - 2. Size: 5-inches wide.
 - 3. Thickness: 1/4 inch.
 - 4. Color: Black
 - 5. Length: 16 feet.
 - 6. Connection method: Double staked at overlap joints and designed to receive tapered steel stakes.
 - 7. Finish: Hot dipped galvanized finish to be applied after steel landscape edging is cut to length and stake pockets are stamped, punched or welded. Galvanization shall comply with ASTM A123/A123M-97A. Zinc coverage shall be to a standard thickness of 3.3 mil.
 - 8. Edging Stakes: Steel, tapered, 16 inches minimum length or more to secure, and finished to match specified steel landscape edging.
 - 9. Standard start/end sections, 90 degree corners, and splicers as required.

2.17 PRE-EMERGENCE WEED KILLER

- A. Clean non-staining as recommended by a licensed pest control specialist.

2.18 TREE STAKES

- A. Lodge pole pine logs, clean, smooth, un-treated.
- B. Unless otherwise shown on drawings, provide two-inch (2") diameter by eight feet (8') long for trees less than 8' high and 1" caliper.
- C. Unless otherwise shown on drawings, provide three-inch (3") diameter by eight to ten feet (8' - 10') long for trees greater than 8' high and 1" caliper.
- D. Provide 3 stakes per tree

2.19 TREE TIES

- A. Unless otherwise shown on drawings, provide rubber strap, 24-inch minimum length without sharp edges adjacent to trunk, V.I.T. cinch-tie, Dublin, CA, (818)882-9530, or approved equal.
- B. Black corded rubber tree ties w/ clips by greensleeves.com

- C. Biodegradable VStrap webbing by Treestrap.

2.20 TREE GUYING SYSTEM:

- A. For trees up to 3" caliper, 3/16" galvanized steel cable, with rubber tree collar, 12" minimum long, and secured with cable clamp, and attached to anchor for below-grade location, Duckbill Model 40 DTS, or approved equal.
- B. For trees 3" to 6" caliper, 3/16" galvanized steel cable with rubber tree collar, 18" minimum long, and secured with cable clamp, 3" take-up eye to eye turnbuckle, and attached to anchor for below-grade location, Duckbill Model 68 DTS, or approved equal.
- C. Rootball guying system with three dead man anchors per tree as shown on drawings.

2.21 MULCH

- A. Organic Mulch:
 - 1. Rail Yard Walk-On Bark
- B. Rock Mulch:
 - 1. Hard, durable smooth, river washed stone, 3/4-inch to 1-inch diameter in grey color range, Lin Creek or equal.
- C. Submit samples of rock mulch for approval by Landscape Architect until acceptable to District, at no extra cost.

2.22 STONES

- A. Stone Maintenance Rock: Smooth 1"-3" grey river rock, Lin Creek or equal. Match existing campus rock.
- B. Smooth 3"-8" Stones grey river rock, Lin Creek or equal to be installed around Drainage Structures to prevent mulch from migrating into stormdrain, and where shown in drawings

PART 3 - EXECUTION

3.1 PLANT PROTECTION AND REPLACEMENT

- A. Inspect and protect all existing and new plants and trees against damage from construction activities, erosion, trespass, insects, rodents, deer, disease, etc. and provide proper safeguards, including trapping of rodent and applying protective sprays and fencing to discourage deer browsing. Maintain and keep all temporary barriers erected to prevent trespass.
- B. Repair all damaged planted areas. Replace plants and re-seed or re-sod turf immediately upon discovery of damage or loss.

3.2 TOPSOIL STRIPPING AND STOCKPILING

- A. Strip existing planting soil to whatever depths encountered in areas that may be compacted due to construction activities and in a manner to prevent intermingling with the underlying subsoil or other objectionable material. Topsoil stripping is limited to area outside "Drip Line" of existing trees to remain and areas indicated on drawings and as approved by the District's Representative.
- B. Remove heavy growths of grass from areas before stripping.

- C. Stockpile existing planting soil in storage piles in areas shown, or where designated by District. Construct storage piles to freely drain surface water. Cover storage piles if required to prevent windblown dust.
- D. If herbicide contamination is suspected then a radish/ryegrass growth trial must be performed. Consult with Landscape Architect prior to decision to test or not.

3.3 LIME TREATED SOIL

- A. If site work includes Lime Treatment of the subsoil, the Contractor shall remove full depth of treated soil beyond 12" from structure(s) and replace with approved planting soil.
- B. Following removal of lime treated material, scarify subgrade to a minimum depth of 6 inches and test for drainage.
- C. Test subgrade in all planting areas for drainage by flooding with minimum 4-inch depth of water puddle and verify complete absorption of standing water within two hours. If standing water is still present after two hours, provide perforated pipe and drain rock "French Drain" system in bottom of non-draining planters and connect to storm drainage system, as accepted by District's Representative prior to backfilling with approved planting soil.

3.4 GENERAL PREPARATION OF PLANTING SOIL

- A. Submit soil analysis report of amended soils from an approved soils laboratory for approval by the Landscape Architect. Refer to Part 1 for soil testing requirements.
- B. All planting soils to be amended as specified in soil laboratory analysis report(s).
- C. Provide a minimum of 12" depth of amended planting soil in all planting areas, or more where shown or specified otherwise. Install soil in maximum 12" lifts. Compact each lift prior to installing subsequent lifts.
- D. Thoroughly wet down the planting areas to settle the soil and confirm irrigation coverage and operation. Allow soil to dry so as to be workable as described herein.
- E. After the rototill work, float areas to a smooth, uniform grade as indicated on the drawings. Slope all planting areas to drain. Roll, scarify, rake and level as necessary to obtain true, even planting surfaces. Remove rocks, sticks and debris 1 inch and larger in size in turf areas and 2 inches or larger in shrub and ground cover areas. Secure approval of the grade by the Landscape Architect before any planting.
- F. Prior to planting, soil shall be loose and friable to a minimum depth of 12" with a relative maximum compaction of 85%. Rip and scarify any overly compacted and re-compacted planting areas (in two directions full depth of compacted soil) prior to planting.
- G. Water settling, puddling, and jetting of soil and backfill materials as a compaction method is not acceptable.
- H. Prior to planting, soil shall be moist, but not so moist that it sticks to a hand shovel. Do not work planting soil in a wet or muddy condition or dump or spread in areas where subgrade is not in proper condition.
- I. Provide planting soil as a final lift in all planting areas within and adjacent to paved areas and other construction where native site soil has been covered by engineered fill and/or base rock. Unless otherwise shown or specified, finish grade in planting islands shall be crowned with a minimum 2% pitch to drain.

- J. Finish Grade: Hold finish grade and/or mulch surface in planting areas 1/2-inch below adjacent pavement surfaces, tops of curbs, manholes, etc. The subgrade of the mulch in mulched planting areas shall be a minus 2 inches at a distance of 12 to 18 inch from the edge of pavement. Drag finish grade to a smooth, even surface. Grade to form all swales and berms. Pitch grade with uniform slope to catch basins, streets, curb, etc., to ensure uniform surface drainage. Areas requiring grading include adjacent transition areas that shall be uniformly sloped between finish elevations. Slope surface away from walls so water will not stand against walls or buildings. Control surface water to avoid damage to adjoining properties or to finished work on the site. Take required remedial measures to prevent erosion of freshly graded areas.
- K. Planting operations shall be performed only during periods when beneficial results can be obtained. When excessive moisture or other unsatisfactory conditions prevail, the work shall be stopped until conditions are satisfactory.

3.5 PREPARATION OF IN-SITU PLANTING SOIL

- A. In-Situ Planting Soil is defined as top soil left in its original place and undisturbed during construction activities which is to receive new planting
- B. Except within tree driplines, rip all planting areas in two directions full depth to a minimum of **[12"]** into undisturbed native subsoil prior to amending. Scarification of any planting area which cannot be accomplished with a tractor shall be accomplished by an alternative method approved by the District's Representative to the specified depth to ensure proper percolation/drainage.
- C. Inspect planting areas and remove all base rock and other foreign material. Verify placement of planting soil within dripline of trees with District's Representative.
- D. Test depth of loose soil with hand shovel in presence of District's Representative in several locations as directed.
- E. After acceptance of the planting condition, uniformly mix and amend soil with required fertilizers, nutrients, etc. per specifications herein and recommendations given in soils reports.
- F. In the case of a contradiction between the quantity of organic amendment required by the soils laboratory analysis and the specified quantity below, the greater of the two quantities shall take precedence. Spread organic amendment, iron and Type A fertilizer evenly over installed and rough graded on-site topsoil in all planting areas including turf, ground cover and shrub areas at the following rates:
 - 1. Organic Amendment: 6 cubic yards per 1,000 square feet
 - 2. Fertilizer: Type A (6-20-20) at 20 lbs. per 1,000 square feet.
 - 3. Iron Sulfate: 10 lbs. per 1,000 square feet
- G. Rototill above additives into soil 8-12" inches deep. Keep iron sulfate off pavement and other surfaces to prevent rust staining. Correct all rust damage to work.
- H. Final planting soil shall have a pH range of 6.5 to 7.5.

3.6 PREPARATION OF IMPORTED PLANTING SOIL (ON-GRADE)

- A. Uniformly distribute and spread Subsoil or select fill in planting areas to achieve rough grading and compact to a maximum of 85% relative compaction.
- B. Except within tree driplines, rip all planting areas in two directions full depth to a minimum of 12" into undisturbed native subsoil prior to backfilling. Scarification of any planting area which cannot be accomplished with a tractor shall be accomplished by an alternative method approved by the District's Representative to the specified depth to ensure proper percolation/drainage.
- C. Thoroughly water-settle subsoil to required subgrade prior to installing Top Soil.

- D. Prior to placing planting soil secure the District's Representatives acceptance of the planting areas subgrade condition. Test depth of loose soil with hand shovel in presence of District's Representative in several locations as directed.
- E. After acceptance of the planting areas subgrade condition, uniformly distribute and spread planting soil backfill over scarified subgrade in planting areas as specified.
- F. Mix and amend soil with required fertilizers, nutrients, etc. per specifications herein and recommendations given in soils reports.

3.7 SOIL PREPARATION FOR STORMWATER TREATMENT PLANTING AREAS

- A. Earthwork, rough grading, and drainage materials shall be complete and approved prior to installation of planting soil.
- B. Do any necessary finish grading in addition to that performed in accordance with earthwork to bring subgrades after final compaction to required grades and sections as indicated.
- C. Install the approved specified soil mix for infiltration planting areas as shown in Drawings. Soil depth to be 18" minimum typical and 24" minimum for planting areas with trees, unless otherwise shown on drawings.
- D. After placement of the mineral component, the top 6" should be blended with the approved compost for stormwater treatment planting areas. If bulk blended, proportions should be 1 part compost to 4 parts of the above mineral component. If blended in place, this is equivalent to 4 ½ cubic yards or 1,000 square feet for blending to 6-inch depth
- E. If organic content of the mineral component is less than 0.6% weight, then it should be blended with compost in volume proportions of 5% compost to 95% mineral.
- F. Finish Grade: Provide a smooth, even surface. Sideslopes of stormwater planting areas (eg. bioswales, basins, etc) not to exceed 3:1 in any direction. Finish grade of flow through planters to be as shown in drawings.

3.8 WEED GERMINATION

- A. Work shall be done under the supervision of a person licensed by the State of California as a pest control applicator and holding a qualified applicator license or a Qualified Applicator Certificate.
- B. Following soil preparation and fine grading of planting areas, irrigate the planting areas to germinate any weed seeds for a minimum period of 21 days. Maintain the soil in a damp condition for a minimum depth of 4 inches. Following approval of the weed germination by the District's Representative, spray kill the weeds using a short lived systemic weed killer that will not affect subsequent planting. Confirm the weed kill and allow the soil to dry out to optimum degree for planting prior to planting.

3.9 PRE-EMERGENCE WEED KILLER

- A. Work shall be done under the supervision of a person licensed by the State of California as a pest control applicator and holding a qualified applicator license or a Qualified Applicator Certificate.
- B. Apply pre-emergence weed killer in all areas to receive ground cover planting. Obtain approval of the finish grades prior to applying weed killer and coordinate planting and watering with the pest control specialist prior to planting. Take care to keep weed killer off areas to be seeded.

3.10 ROOT BARRIER

- A. Install in continuous sheet parallel and adjacent to curb or pavement edge as required on drawings and in accordance with manufacturer's recommendations. Set top of barrier approximately ½-inch above finished soil surface to allow concealment with mulch, as accepted by District's Representative

3.11 BAMBOO RHIZOME BARRIER

- A. Install in linear fashion along and adjacent to the edges of the planting area as detailed or, if not shown, in accordance with manufacturer's recommendations. Overlap at joints minimum 12" using double stick tape as recommended by barrier manufacturer. Set top of barrier approximately 2-inches above finished soil surface to allow concealment with mulch, as accepted by District's Representative.

3.12 EROSION CONTROL NETTING

- A. Verify finished grades and provide Jute Mesh and single grind Redwood bark mulch on all slopes 3:1 and steeper as accepted by the District's Representative. Install jute mesh loosely up and down the slope in accordance with manufacturer's specifications and as follows. Fit the soil surface contour and hold in place with 12-inch long, 11-gauge (minimum) steel wire staples driven vertically into the soil at 18- to 24-inch spacing. Jute mesh strips shall overlap along all edges at least 6 inches. Ends of side strips shall be buried into the soil at least 6 inches. Drive staples along edges to securely anchor mesh to ground.

3.13 ALUMINUM EDGING

- A. Install as shown in drawings in continuous strips as indicated and in accordance with manufacturer's recommendations with stakes spaced 48 inches on center maximum and at all joints.

3.14 HEADER BOARD

- A. Install in continuous, smooth alignment as indicated with stakes spaced 48 inches on center maximum and at all joints.

3.15 TREE AND SHRUB PLANTING

- A. Mark tree and shrub locations on site using stakes, gypsum or similar approved means and secure location approval by the Landscape Architect before plant holes are dug. Adjust location as required prior to planting.

- B. Review location of plants in relationship to irrigation heads and adjust location(s) that interfere with the function of the spray heads. Adjust locations as required to ensure that the plant roots receive the proper amount of water in order for the plants to thrive.

- C. Square Tree Pits

- 1. Drilled tree pits shall be modified to a square pattern with pit walls scarified to promote root penetration.

- D. Excavate tree, shrub and vine pits as follows:

	<u>Width</u>	<u>Depth</u>
Boxed Trees	Box + 24"	Box depth
Canned Trees (15 gc)	Can + 18"	Can depth
Canned Shrubs/Vines (1- 5 gc)	Can + 12"	Can depth

- E. Test drainage of plant beds and tree pits by filling with water (minimum 6"). The retention of water in planting beds and plant pits for more than two (2) hours shall be brought to the attention of the Landscape Architect. If rock, underground construction work, tree roots, poor drainage, or other obstructions are encountered in the excavation of plant pits, alternate locations may be selected by Landscape Architect.

- F. Break and loosen the sides and bottom of tree pits to ensure root penetration and water test hole for drainage as required above.
- G. Excavate plant hole or tree pit keeping excavated planting soil layer on the surface when backfilling around the plant. Carefully set plants as detailed without damaging the rootball. Superficially cut edge roots vertically on three sides. Remove bottom of plant boxes before planting. Remove sides of boxes after positioning the plant and partially backfilling.
- H. Set plants in backfill with top of the rootball 1 inch above finished grade of adjacent soil. Backfill remainder of hole and soak thoroughly by jetting with a hose and pipe section. Water backfill until saturated the full depth of the hole.
- I. Backfill plant holes with mix as specified, free from rocks, clods or lumpy material. Backfill native soil free of soil amendments under rootball and foot tamp to prevent settlement. Backfill remainder of the hole with soil mix and place plant tablets or packets (Type B fertilizer) 3 inches below finish grade and 1/2-inch from roots at the following rates:

gallon can plant	-	1 tablet or packet
5 gallon can plant	-	3 tablets or packet
15 gallon can plant	-	6 tablets or packet
24-inch box plant	-	6 tablets or packet
36-inch box plant	-	8 tablets or packet

- J. Except for acid loving plants (Azaleas, Rhododendrons, Ferns, Camellias, etc.), use a soil mix of 2 parts soil from the hole, and 1 part amendment with iron added at the following rates:

gallon can plants	-	iron, 1/4 cup
5 gallon can plants	-	iron, 1/3 cup
15 gallon can plants	-	iron, 1/2 cup
24" box and larger	-	iron, 1 cup

For acid loving plants (Azaleas, Rhododendrons, Ferns, Camellias, etc.), mix 1 part soil from the hole and 1 part amendment to use a backfill around the plants.

Mix the iron, amendment and soil thoroughly for use in the top 8 inches of backfill around plants. For acid loving plants, mixture to be 1/2 soil from the hole and 1/2 amendment.

- K. Remove any soil from top of plant rootballs and secure Landscape Architect's approval of rootball height prior to mulching.
- L. After approval of rootball height, install mulch as required below.
- M. Stake and/or guy trees as detailed. Drive stake(s) until solid (at least 12" beyond bottom of rootball) and remove excess stake protruding above top tree tie to prevent rubbing against branches. Avoid driving stakes through rootball. If subgrade does not accept stakes to a stable degree, delete stakes and guy the trees as specified herein and as detailed. Locate tree ties to avoid contact with tree branches. Locate top tie at tree flex point.
- N. Build watering basin berms around trees and shrubs to drain through rootball. Basins are not required around trees in turf areas. Water backfill until saturated the full depth of the hole.

3.16 GROUND COVER PLANTING

- A. Plant in neat, straight, parallel and staggered rows as indicated on plan. Plant first row one-half required ground cover spacing behind adjacent curbs, structures, or other plant bed limits. Plant ground cover to edge of water basins of adjacent trees and shrubs.

3.17 SODDED TURF

- A. Install sod to patch and repair existing turf area due to re-grading or other construction activities.
- B. Lightly roll surface and re-shape to level humps and hollows. Secure Landscape Architect's approval prior to sodding. Do not sod on dry soil.
- C. Lay first strip of sod along a straight line (use a string in irregular areas). Butt joints tightly, do not overlap edges. On second strip, stagger joints. Use a sharp knife to cut sod to fit curves, edges and sprinkler heads.
- D. When a conveniently large area has been sodded, water lightly to prevent drying. Continue to sod and to water until installation is complete.
- E. After laying all sod, roll lightly to eliminate irregularities and to form good contact between sod and soil. Avoid a heavy roller and excessive initial watering.
- F. Thoroughly water the completed sod surface to at least 8 inches deep. Repeat sprinkling at regular intervals to keep sod moist at all times until rooted. After sod is established, decrease frequency and increase amount of water per application.
- G. Protect turf areas by erecting fences, barriers and signs necessary to prevent trespass. Keep barriers neat and well maintained.

3.18 MULCH

- A. Except where rock mulch is required, mulch all tree, shrub and ground cover areas with organic mulch to a 3-inch depth, except mulch to 2-inch depth where planting with ground cover plants from flats.
- B. Hold bark mulch away from base (trunk) of plant 4" or as directed by the Landscape Architect.
- C. Individual trees and/or shrubs planted in non-irrigated areas shall, at minimum, receive bark mulch over their watering basin and berm.
- D. No mulch is required around trees in turf areas.
- E. Install rock mulch to depth as detailed, minimum 2-inches for full coverage of soil surface, whichever is greater.

3.19 WATERING

- A. Water all trees, shrubs and ground cover immediately after planting. Apply water to all plants as often and in sufficient amount as conditions may require to keep the plants in a healthy vigorous growing condition until completion of the Contract. Provide supplemental hand watering of trees and shrubs, as required, to maintain a moist root zones throughout plant establishment period.

3.20 PRE-MAINTENANCE PERIOD REVIEW AND APPROVAL OF PLANTING

- A. Maintain plants from time of delivery to site until final acceptance of landscape installation.
- B. Receive approval of the installed planting prior to commencement of planting establishment maintenance period. Notify the Landscape Architect or District's Representative a minimum of seven (7) days prior to requested review. Before the review, complete the following:
 - 1. Complete all construction work.

2. Present all planted areas neat and clean with all weeds removed and all plants installed and appearing healthy.
3. Plumb all trees and tree and shrub supports.
4. No partial approvals will be given.

3.21 PLANTING ESTABLISHMENT MAINTENANCE

A. General Requirements

1. Maintenance Period: The planting establishment maintenance period required shall be **one year** after all planting and irrigation is complete, turf is installed/seeded, and as approved by District's representative. A longer period may be required if the turf is not thick, vigorous and even and has been mowed a minimum of 4 times, or if the plant material is not acceptably maintained during the maintenance period. The start of the maintenance period to be confirmed by District's representative. Contractor to notify landscape architect of start and end dates of maintenance period. The maintenance period may be suspended at any time upon written notice to the Contractor that the landscaping is not being acceptably maintained, and the day count suspended until the landscape is brought up to acceptable standards as determined by the District Representative.
2. Planting establishment maintenance immediately follows, coincides with, and is continuous with the planting operations, and continues through turf installation, and after all planting is complete and accepted; or longer where necessary to establish acceptable stands of thriving plants.
3. Protect all areas against damage, including erosion, trespass, insects, rodents, disease, etc. and provide proper safeguards. Maintain and keep all temporary barriers erected to prevent trespass.
4. Keep all walks and paved areas clean. Keep the site clear of debris resulting from construction or maintenance activities.
5. Repair all damaged planted areas, and replace plants and resod turf immediately upon discovery of damage or loss.
6. Check sprinkler systems at each watering; adjust coverage and clean heads immediately. Adjust timing of sprinkler controller to prevent flooding.
7. Maintain adequate moisture depth in soil to ensure vigorous growth. Check rootball of trees and shrubs independent of surrounding soils and hand water as required.
8. Keep contract areas free from weeds by cultivating, hoeing or hand pulling. Use of chemical weed killers will not relieve the Contractor of the responsibility of keeping areas free of weeds at all times.

B. Tree and Plant Maintenance

1. Maintain during the entire establishment period by regular watering, cultivating, weeding, repair of stakes and ties, and spraying for insect pests. Prune when requested by the Landscape Architect.
2. Keep watering basins in good condition and weed-free at all times.
3. Replace all damaged, unhealthy or dead trees, shrubs, grasses, vines and ground covers with new stock immediately; size as indicated on the drawings.

C. Palm Tree Maintenance

1. Do not over water palm trees. Do not use a predetermined watering schedule for the palms. Use a soil probe to determine optimum soil moisture level within the rootball.
2. Palm Tree Fertilizing: After palms show new frond growth, approximately 6 to 8 weeks after planting, apply specified balanced fertilizer with trace elements. Repeat application after 3 to 4 months. Established palms shall be fertilized spring and fall.
3. Check palms for plumb and re-plumb as required.
4. Check palms periodically for Penicillium Rot and Fusarium Wilt. If the apical bud has fallen over (Penicillium Rot symptom) or Fusarium Wilt is suspected, remove the affected tree immediately.
5. Reapply broad-spectrum fungicide labeled for landscape use on soil borne diseases for Palms as noted herein under Palm Tree Planting.

D. Turf Maintenance:

1. Maintain during the entire establishment period. Cut as frequently as growth of grass requires. Cut to a height of two inches (2"), unless otherwise directed by the Landscape Architect.
2. Maintain constant moisture to a depth of eight inches (8").

3. Trim edges of turf at paving and headerboards at time of second cutting, and at each later cutting.
4. Keep a 2-foot diameter area at tree trunk free of turf at all times to serve as a mowing band. Do not create low area around base of tree.
5. Keep turf areas free of undesirable weeds and grasses by the application of suitable selective weed killers or hand pulling.
6. Re-sod any turf areas damaged by construction activities as soon as evident.
7. Repair any gaps, hollow, settled or eroded areas by filling, rolling and re-sodding.

E. Fertilizing:

1. Upon approval and after submitting fertilizer delivery tags, maintenance fertilization shall begin 30 days after planting is complete. Fertilize all turf and ground cover areas by broad-casting Type C (21-7-14) fertilizer at the rate of 5 lbs. per 1,000 square feet evenly throughout. Reapply every forty-five (45) days until acceptable.
2. During the winter, for quick turf greening effect, calcium nitrate (15.5-0-0) may be applied at the rate of 6 lbs. per 1,000 square feet.
3. Early spring and fall substitute a complete fertilizer such as 15-15-15 applied at the rate of 6 lbs. per 1,000 square feet, to help insure continuing adequate phosphorus and potassium.
4. Apply ammonium sulfate fertilizer as necessary to maintain vigorous, green grass between fertilizations mentioned above.
5. Observe plant's color, and if a soil pH imbalance is suspected, take soil samples and obtain laboratory analysis for confirmation. Take necessary action recommended in laboratory analysis such as top dressing with soil sulfur, leaching soil, etc.

3.22 FINAL PLANTING REVIEW AND ACCEPTANCE

- A. At the conclusion of the Maintenance Period, schedule a final review with the District, the District's maintenance person, and/or the Landscape Architect. On such date, all project improvements and all corrective work shall have been completed. If all project improvements and corrective work are not completed, continue the planting establishment maintenance period at no additional cost to the District until all work has been completed. This condition will be waived by the District under such circumstances wherein the District has granted an extension of time to permit the completion of a particular portion of the work beyond the time of completion set forth in the Agreement.
- B. Submit written notice requesting review at least 10 days before the anticipated review.
- C. Prior to review, weed and restore all planted areas, mow and edge turf, plumb trees and tree supports, clear the site of all debris and present in a neat, orderly manner.

END OF SECTION

SECTION 331000 - WATER SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

- A. This section describes general requirements, products, and methods of execution relating to on-site domestic water and fire water systems serving all buildings and appurtenances. Unless otherwise noted, this section does not apply to irrigation water systems and water systems inside and within 5 feet of buildings. This section applies to:
1. Domestic water distribution and services.
 2. Fire water distribution and services.
 3. Water storage tanks.
- B. Contractor shall provide all labor, equipment, materials, and testing services unless otherwise noted.
- C. Related Sections:
1. Section 31 23 33 – TRENCHING, BACKFILLING, AND COMPACTING.
 2. Section 26 42 00 – CATHODIC PROTECTION
- D. Water pressure data:
1. Provided by: [Xxxxx]
 2. Testing Date: [Month Year]
 3. Location: [FH #, intersection, or address]
 4. Static Pressure: [xx.x] psig
 5. Residual Pressure: [xx.x] psig
 6. Flow: [x,xxx] gpm
 7. Orifice Size: [2.5 inch]
 8. Contractor shall notify Engineer if actual water pressure encountered varies by ± 10 psig.

1.2 SUBMITTALS

- A. Comply with requirements of Section 01 33 00 – SUBMITTAL PROCEDURES.
- B. Product Data: Manufacturer's literature and data, including, where applicable, sizes, pressure rating, rated capacity, listing/approval stamps, labels, or other marking on equipment made to the specified standards for materials, and settings of selected models, for the following:
1. Piping and fittings.
 2. Gaskets, couplings, sleeves, and assembly bolts and nuts.
 3. Gate valves and ball valves.
 4. Blow-off valves, air release and vacuum valves, and combination air valves.
 5. Check valves.
 6. Pressure reducing valves.
 7. Backflow preventers.
 8. Valve boxes, frames and covers.
 9. Water meter boxes, frames and covers.
 10. Post indicators.
 11. Fire department connections and wet stand pipes.
 12. Fire hydrants.
 13. Thrust block concrete mix and/or restrained joints and fittings.
 14. Tapping sleeves and tapping valves.
 15. Service saddles and corporation stops.
 16. Identification materials and devices.
 17. Corrosion protection.
 18. Water sampling stations.

- C. Shop Drawings and Calculations: Where an on-site fire water system is required, Contractor shall provide shop drawings for engineer and agency approval prior to construction. Coordinate with the Contract Documents and identify any proposed modifications or deviations. Shop Drawings and Calculations shall be stamped and signed by a registered Fire Protection Engineer licensed by the State of California.
1. Include the following information:
 - a. Design assumptions.
 - b. Thrust block sizing and calculations.
 - c. Materials to be used.
 - d. Available water pressure.
 - e. Required water pressure.
 2. The review of fire system components constitutes only a portion of the review and approval required. A copy of the fire system component submittal package shall be forwarded by the Contractor to the Local Fire Authority for further review and approval.

1.3 QUALITY ASSURANCE

- A. Comply with the latest edition of the following Standards and Regulations:
1. American Water Works Association (AWWA) and American National Standards Institute (ANSI):
 - a. C104/A21.4 ANSI Standard for Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water.
 - b. C105/A21.5 ANSI Standard for Polyethylene Encasement for Ductile-Iron Pipe Systems.
 - c. C110/A21.10 ANSI Standard for Ductile-Iron and Gray-Iron Fittings, 3 inch - 48 inch for Water.
 - d. C111/A21.11 ANSI Standard for Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
 - e. C115/A21.15 ANSI Standard for Flanged Ductile-Iron Pipe with Ductile-Iron or Gray-Iron Threaded Flanges.
 - f. C116/A21.16 ANSI Standard for Protective Fusion-Bonded Epoxy Coatings Interior & Exterior Surfaces for Ductile-Iron and Gray-Iron Fittings.
 - g. C150/A21.50 ANSI Standard for Thickness Design of Ductile-Iron Pipe.
 - h. C151/A21.51 ANSI Standard for Ductile-Iron Pipe, Centrifugally Cast, for Water.
 - i. C153/A21.53 ANSI Standard for Ductile-Iron Compact Fittings for Water Service.
 - j. C500 Metal-Seated Gate Valves for Water Supply Service.
 - k. C502 Dry-Barrel Fire Hydrants.
 - l. C503 Wet-Barrel Fire Hydrants.
 - m. C504 Rubber-Seated Butterfly Valves.
 - n. C507 Ball Valves, 6 inches - 48 inches.
 - o. C508 Swing-Check Valves for Waterworks Service, 2 inches - 24 inches NPS.
 - p. C509 Resilient-Seated Gate Valves for Water Supply Service.
 - q. C510 Double Check Valve Backflow Prevention Assembly.
 - r. C511 Reduced-Pressure Principle Backflow Prevention Assembly.
 - s. C512 Air Release, Air/Vacuum, and Combination Air Valves for Waterworks Service.
 - t. C550 Protective Epoxy Interior Coating for valves and Hydrants.
 - u. C600 Installation of Ductile-Iron Water Mains and their Appurtenances.
 - v. C602 Cement- Mortar Lining of water Pipelines in place- 4 inches and larger.
 - w. C605 Underground Installation of Polyvinyl Chloride (PVC) Pressure Pipe and Fittings for Water.
 - x. C651 Disinfecting Water Mains
 - y. C652 Disinfection of Water-Storage Facilities
 - z. C800 Underground Service Line Valves and Fittings for 1/2 inches - 2 inches.
 - aa. C900 Polyvinyl Chloride (PVC) Pressure Pipe, and Fabricated Fittings, 4 inches - 12 inches, for Water Distribution.
 - bb. C901 Polyethylene (PE) Pressure Pipe and Tubing, 1/2 inches through 3 inches, for Water Service.
 - cc. C905 Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 14 inches - 48 inches.
 - dd. C906 Polyethylene (PE) Pressure Pipe and Fittings, 4 inches - 63 inches, for Water Distribution and Transmission.
 - ee. C907 Polyvinyl Chloride (PVC) Pressure Fittings for Water, 4 inches - 8 inches.

- ff. C908 PVC Self-Tapping Saddle Tees for Use on PVC Pipe.
- gg. D103 Factory-Coated Bolted steel Tanks for water Storage.
- 2. National Fire Protection Association (NFPA):
 - a. NFPA 13 Standard for the Installation of Sprinkler Systems.
 - b. NFPA 14 Standard for the Installation of Standpipe, Private Hydrants, and Hose Systems.
 - c. NFPA 20 Standard for the Installation of Stationary Pumps for Fire Protection.
 - d. NFPA 22 Standard for Water Tanks for Private Fire Protection.
 - e. NFPA 24 Private Service Mains and their Appurtenances.
 - f. NFPA 25 Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems.
- 3. Uni-Bell Plastic Pipe Association (UNI).
 - a. PUB 3 PVC Pipe – Technology Serving the Water Industry.
 - b. PUB 7 External Corrosion of Underground Water Distribution Piping Systems.
 - c. PUB 8 Tapping Guide for AWWA C900 Pressure Pipe.
 - d. PUB 9 Installation Guide for PVC Pressure Pipe.
 - e. B-8 Recommended Practice for the Direct Tapping of Polyvinyl Chloride (PVC) Pressure Water Pipe (Nominal Diameters 6-12 inch).
- 4. American Society of Testing and Materials (ASTM).
 - a. ASTM A536 Standard Specification for Ductile Iron Castings.
 - b. ASTM A674 Standard Practice for Polyethylene Encasement for Ductile Iron Pipe for Water or Other Liquids.
 - c. ASTM D1785 Standard Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120.
 - d. ASTM D2241 Standard Specification for Poly (Vinyl Chloride) (PVC) Pressure-Rated Pipe.
 - e. ASTM D2466 Standard Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40.
 - f. ASTM D2564 Standard Specification for Solvent Cements for Poly (Vinyl Chloride) (PVC) Plastic Piping Systems.
 - g. ASTM D2683 Standard Specification for Socket-Type Polyethylene Fittings for Outside Diameter-Controlled Polyethylene Pipe and Tubing.
 - h. ASTM D3139 Standard Specification for Joints for Plastic Pressure Pipes Using Flexible Elastomeric Seals.

- C. Comply with City of Livermore Standards and authorities having jurisdiction for the installation and testing of potable water piping and fire protection systems.
- D. Comply with City of Livermore Standards and authorities having jurisdiction for the installation, testing and separation requirements of recycled/reclaimed water piping and fire protection systems.
- E. All testing of systems specified in this section shall be witnessed by representatives of the local water department or local authority. Provide at least 7 days notice.

PART 2 - PRODUCTS

2.1 PIPING

- A. Water Distribution Main (pipe size 4 inches and larger).
1. Ductile Iron Pipe (DIP): Pressure Class 350 pipe conforming to AWWA/ANSI C151/A21.5, cement-mortar lining conforming to AWWA/ANSI C104/A21.4, with standard thickness per AWWA/ANSI C150/A21.50. U.S. Pipe, American Cast Iron Pipe Company (ACIPCO), or approved equivalent.
 - a. Flanged ends shall conform to AWWA/ANSI C115/A21.15.
 - b. Rubber-gasket joints shall conform to AWWA/ANSI C111/A21.11.
 2. Polyvinyl Chloride Pipe (PVC): Pressure Class 235, DR 18, spigot and gasket bell end, conforming to AWWA C900 or AWWA C905, with equivalent cast-iron pipe outer diameter (O.D.). J-M Manufacturing, PW Pipe, North American Pipe Company, or approved equivalent.
 3. Polyethylene Pipe (PE): PE 4710, ASTM F714, Pressure Class 200, DR 9, conforming to AWWA C906, or approved equivalent.
- B. Water Service Line (pipe size 3 inches and smaller)
1. Copper (Cu): Provide Type K soft or hard copper pipe conforming to ASTM B88.
 2. High Density Polyethylene Pipe (HDPE): PE4710, Pressure Class 200, DR 9 conforming to AWWA C901. J-M Manufacturing PIPE or approved equivalent.
- C. Recycled/Reclaimed Water piping shall be purple.

2.2 FITTINGS, GASKETS, COUPLINGS, SLEEVES, AND ASSEMBLY BOLTS AND NUTS

- A. For DIP: Provide fittings with pressure rating greater than or equal to that of the pipe. Provide flanged joints, mechanical joints, push-on joints, and insulating joints where indicated. Fittings with push-on joint ends shall conform to the same requirements as fittings with mechanical-joint ends. Provide mechanically coupled type joints using a sleeve-type mechanical coupling where indicated. Provide ends of pipe and fittings suitable for the specified joints. Fittings shall have cement-mortar lining conforming to AWWA/ANSI C104/A21.4.
1. Flanged Joints: Provide bolts, nuts, and gaskets in conformance with AWWA/ANSI C115/A21.15. Flanged fittings shall conform to AWWA/ANSI C110/A21.10 or C153/A21.53.
 - a. Provide flange for set screwed flanges of ductile iron, ASTM A536, Grade 65-45-12, and conform to the applicable requirements of ASME B16.1, Class 250.
 - b. Provide setscrews for set screwed flanges of 190,000 psi tensile strength, heat treated and zinc-coated steel.
 - c. Gaskets for set screwed flanges shall conform to the applicable requirements for mechanical-joint gaskets specified in AWWA/ANSI C111/A21.11.
 - d. Design of set screwed gaskets shall provide for confinement and compression of gasket when joint to adjoining flange is made.
 - e. Unless otherwise required, above ground flange assembly bolts shall be standard hex-head, cadmium plated machine bolts with American Standard Heavy, hot-pressed, cadmium plated hexagonal nuts. Buried flange nuts and bolts shall be as above except they shall be of Type 304 stainless steel.
 2. Mechanical Joints: Dimensional and material requirements for pipe ends, glands, bolts and nuts, and gaskets shall conform to AWWA/ANSI C111/A21.11.
 3. Push-on Joints: Provide shape of pipe ends and fitting ends, gaskets, and lubricant for joint assembly conforming to AWWA/ANSI C111/A21.11. Modify bell design fittings, as approved.
 4. Insulating Joints: Provide a rubber-gasketed or other suitable approved type of insulating joint or dielectric coupling which will effectively prevent metal-to-metal contact at the joint between adjacent sections of dissimilar metals.
 - a. Provide joint of the flanged type with insulating gasket, insulating bolt sleeves, and insulating washers.
 - b. Provide gasket of the dielectric type, full face, as recommended in AWWA/ANSI C115/A21.15.
 - c. Provide bolts and nuts as recommended in AWWA/ANSI C115/A21.15.
 - d. Fittings shall be epoxy lined and coated with a thickness not less than 6-mils.
- B. For PVC: Fittings shall be DIP or PVC.

1. DIP fittings: Provide gray-iron or ductile-iron conforming to AWWA/ANSI C110/A21.10, with cement-mortar lining conforming to AWWA/ANSI C104/A21.4, and standard thickness, with equivalent cast-iron pipe O.D.
 - a. Fittings with push-on joint ends shall conform to the same requirements as fittings with mechanical-joint ends, except the bell design shall be modified, as approved, for push-on joint suitable for use with PVC plastic pipe.
 - b. Provide push-on joints, compression joints and mechanical joints where indicated between pipe and fittings, valves, and other accessories.
 - c. Mechanical joints, glands, bolts and nuts, and gaskets shall conform to AWWA/ANSI C111/A21.11.
 - d. Fittings shall be epoxy coated with a thickness not less than 6-mils.
 2. PVC fittings: Provide fabricated PVC fittings for pressure pipe conforming to AWWA C900, C905, or C907.
 - a. PVC fittings shall conform to ASTM D2466.
 - b. Push-on joints shall conform to ASTM D3139.
 - c. Compression joints shall conform to ASTM D3139.
 - d. Provide each joint connection with an elastomeric gasket suitable for the bell or coupling with which it is to be used. Gaskets shall conform to ASTM F477.
- C. For PE: Fittings shall conform to AWWA C901 or AWWA C906. Driscopipe, or approved equivalent.
1. Socket type fittings shall conform to ASTM D2683.
 2. Butt fusion fittings shall conform to ASTM D3261.
 3. Electrofusion fittings shall comply with ASTM F1055.
- D. For Cu:
1. Cast copper alloy solder-joint pressure fittings shall conform to ASME B16.18.
 2. Wrought copper solder-joint pressure fittings or wrought copper alloy unions shall conform to ASME B16.22
 3. Cast copper alloy flare fittings shall conform to ASME B16.26.
 4. Wrought copper alloy body, hexagonal stock, metal-to-metal seating surfaces, and solder-joint threaded ends shall conform to ASME B1.20.1.
 5. Compression connections shall be Mueller 110, Ford or approved equivalent.
- E. For HDPE:
1. Cast Copper Fittings shall conform to ASME B16.18.
 2. Cast Copper Compression Fittings and connections shall be Mueller 110 Ford or approved equivalent.
 3. HDPE Fittings shall conform to PE4710, Pressure Class 200, DR 9 conforming to AWWA C901. Walseley Industrial Group or approved equivalent.

2.3 GATE VALVES AND BALL VALVES

- A. Gate Valves: Valves shall open by counterclockwise rotation of the valve stem. Provide valves with ends as appropriate for the adjoining pipe.
1. Stuffing boxes shall have O-ring stem seals. Provide stuffing boxes bolted and constructed so as to permit easy removal of parts for repair.
 2. Valves (2-1/2 inches and larger):
 - a. Provide valves conforming to AWWA C500 or AWWA C509 and of one manufacturer. Valves shall have a non-rising stem, a 2-inch square nut, and double-disc gates. Valves shall be rated for 250 psi maximum working pressure. Mueller 2360 series, ACIPCO, or approved equivalent.
 - b. For the domestic water system, valves shall also conform to ANSI/NSF 61.
 - c. For the fire water system, valves 2 inches through 16 inches in size shall also conform to UL 262 and FM 1120 or FM 1130 to a working pressure of 200 psi.
 3. Where a post indicator is shown, provide valve with an indicator post flange.
- B. Ball Valves: Valves shall open by counterclockwise rotation of the valve stem. Provide valves with ends as appropriate for the adjoining pipe.
1. Valves (2-inches and smaller):

- a. Provide valves conforming to AWWA C800 and of one manufacturer. Mueller 300 Series, Ford, or approved equivalent.
2. Provide valve with operating nut or handle as shown on the Construction Documents.

2.4 BLOW-OFF VALVES, AIR RELEASE AND VACUUM VALVES, AND COMBINATION AIR VALVES

- A. Blow-off valves: Provide valve and service size as shown in the Contract Documents. Provide 2-inch valves at low points of the piping system, and 4-inch valves at dead-ends of the piping system, unless otherwise directed by the Engineer.
1. 2-inch blow-off shall have a 2-inch vertical female iron pipe (FIP) inlet and a 2-inch normal pressure and temperature (NPT) nozzle outlet with cap. Valve shall open by counterclockwise rotation of a top-mounted 9/16-inch square operating nut. All working parts shall be serviceable without excavation. Kupferle/Truflo Model TF550, or approved equivalent.
 2. 4-inch blow-off shall have a 4-inch vertical FIP inlet and a 4-inch male iron pipe (MIP) outlet with cap. Valve shall open by counterclockwise rotation of a top-mounted 9/16-inch square operating nut. All working parts shall be serviceable without excavation. Kupferle/Truflo Model TF800, or approved equivalent.
- B. Air release and vacuum valves: Provide valve and service size as shown on the Contract Documents, and where there is an increase in the downward slope or a decrease in the upward slope of the piping system. Valve shall have cast-iron single valve body, and shall conform to AWWA C512. A compound lever system shall have a maximum operating pressure of 300psi. Provide a protective cap for the outlet of the valve. Provide universal air-vacuum type valves, Crispin Model UL, Apco, or approved equivalent.
- C. Combination air valves: Provide valve and service size as shown on the Contract Documents, and at high points and sharp changes in gradient of the pipe system. Valve shall have cast-iron single valve or double valve body, and shall conform to AWWA C512. A simple or compound lever system shall have a maximum operating pressure of 300psi. Provide a protective cap for the outlet of the valve. Crispin Model C, Apco, or approved equivalent.

2.5 CHECK VALVES

- A. Valves: Valves shall have clear port opening and a cast-iron body. Provide spring-loaded or weight-loaded valves where indicated on the Construction Documents.
1. For the domestic water system, provide swing-check type valves conforming to AWWA C508. Provide valves of one manufacturer. Mueller, Apco, or approved equivalent.
 2. For the fire water system, provide swing-check type valves conforming to FM 1210 and UL 312. Mueller, Watts, or approved equivalent.

2.6 PRESSURE REDUCING VALVES

- A. Pressure Reducing Valves: Valves shall have a cast-iron body, conforming to ASTM A536, with epoxy interior coating conforming to AWWA, and rated to Pressure Class 300. Cla-Val Model 90-01, Singer, or approved equivalent.
1. Valves shall have flanged ends.
 2. Valves sized 3-inches or smaller may have screwed ends.

2.7 POST INDICATORS

- A. Posts Indicators shall withstand up to 900 ft-lbs of operating torque, be free-standing, and tamper-proof.
- B. Post Indicators shall conform to UL 789 and FM 1110. Mueller, ACIPCO, or approved equivalent.
- C. Post indicators on recycled/reclaimed systems shall be painted purple.

2.8 VALVE BOXES, METER BOXES, FRAMES AND COVERS

- A. Water Valve Box: Provide pre-cast concrete valve box for each buried valve. Provide box with steel or cast iron traffic cover marked "WATER." Christy Model G5 with G5C cover or approved equivalent.
- B. Valve or Meter Boxes: Contractor shall verify box size required for water system appurtenances as shown in the Contract Documents. Provide a precast concrete utility box for each buried appurtenance. Provide a traffic-rated lid for H2O loading. A non-traffic rated lid may be used for boxes located in landscape areas. Christy, or approved equivalent.
- C. Valve boxes, meter boxes, frames and covers on recycled/reclaimed systems shall be purple.

2.9 BACKFLOW PREVENTERS

- A. Provide backflow preventers as shown on the Contract Documents. Subject to local water department approval. Backflow preventers on the fire water system shall be subject to approval by the local office of the Fire Marshal.
- B. Reduced Pressure Principle Assemblies (RPPA): Provide a cast-iron body RPPA consisting of two independently operating check valves with a pressure differential relief valve located between the two check valves, two shut-off valves and four test cocks. RPPA shall be tamper-proof and conform to AWWA C511. Febco LF860, Watts, or approved equivalent.
- C. Double Check Detector Assemblies (DCDA): Provide a cast-iron body DCDA consisting of mainline double check assemblies in parallel with a bypass double check and meter assembly, two shut-off valves and four test cocks. DCDA shall be tamper-proof and conform to AWWA C510. Febco LF856, Watts, or approved equivalent.
- D. Backflow preventers on recycled/reclaimed systems shall be painted purple.

2.10 FIRE DEPARTMENT CONNECTIONS AND WET STAND PIPES

- A. Fire Department Connections (FDC): Provide FDC's with 2-1/2 inch female hose connections, sidewalk or free-standing type. Number of inlets shall be as shown on the Contract Documents. Clapper and spring check inlets shall each have a minimum capacity of 250 gpm, and be furnished with Knox FDC plug. Outlet shall be sized for simultaneous use of all inlets. Connection shall be branded "AUTO SPKR".
 - 1. 2-Way FDC: Connection shall conform to UL 405 or FM 1530. Elkhart, Croker, or approved equivalent.
 - 2. 3-Way FDC: Connection shall be subject to approval by the local water department or fire marshal. Elkhart, Croker, Potter-Roemer or approved equivalent.
 - 3. 4-Way FDC: Connection shall conform to UL 405. Potter-Roemer, Croker, or approved equivalent.
 - 4. 6-Way FDC: Connection shall be subject to approval by the local water department or fire marshal. Croker, Potter-Roemer or approved equivalent.
- B. Wet Stand Pipes (WSP): Provide 2-Way WSP's with valves and two (2) 2-1/2 inch male hose connections free-standing type, with a 4" inlet. Each outlet shall each have a minimum capacity of 250 gpm, and be furnished with a Knox cap. Water to the WSP shall be controlled with a remote valve. Connection shall be branded "HYDRANT." Subject to approval by the local water department or fire marshal. Croker, Elkhart, Potter-Roemer or approved equivalent. Fire department connections and wet stand pipes on recycled/reclaimed systems shall be painted purple.

2.11 FDC AND WET STAND PIPE CAPS AND PLUGS

- A. Provide Knox caps or plugs for all new FDC and wet-stand pipes included in the project. Coordinate the number of Knox keys as well as the key signage location with the local Fire Marshal.

2.12 FIRE HYDRANTS

- A. Provide two 2-1/2 inch and one 4-1/2 inch outlets with a 6-inch nominal inside diameter inlet and break-away type bolts. Hydrant shall have a working pressure of 250 psi and shall conform to AWWA C502 or C503, and be UL listed and FM approved. Provide hydrants of one manufacturer. Clow 800 series, Mueller, ACIPCO, or approved equivalent, subject to approval by the local water department and Fire Marshal. Hydrants on recycled/reclaimed systems shall be painted purple. Dry barrel hydrants shall be Mueller Company Super Centurion 200, or approved equivalent.

2.13 THRUST BLOCKS AND PIPE RESTRAINTS

- A. Blocks: Provide thrust blocks in accordance with NFPA 24 Standards. Use concrete conforming to ASTM C94 having a minimum compressive strength of 2,500 psi at 28 days; or use concrete of a mix not leaner than one part cement, 2-1/2 parts sand, and 5 parts gravel, having the same minimum compressive strength.
- B. Pipe Restraints: Provide thrust restraint systems for fittings and joints as required or as indicated on the Plans.
 - 1. For mechanical joint fittings and joints: Pipe restraints shall be "Mega-Lug" pipe restraint system by EBBA Iron, Inc., or approved equivalent.
 - 2. For push-on joint fittings and joints: Pipe restraints shall be "Field-Lok" gaskets by U.S. Pipe (or approved equivalent) or serrated restraint harness by EBAA Iron, Inc.
- C. Thrust blocks, gravity blocks, or mechanical pipe restraints may be used at Contractor's option, unless otherwise indicated on the Plans.
- D. Provide thrust blocks or mechanical pipe restraints at all fittings and changes in angle, alignment or elevation.
- E. Where depth or location of water piping, existing utilities, or other structures prohibit the use of standard thrust blocks, gravity blocks or mechanical pipe restraints may be used. Conform to NFPA 24 Standards.

2.14 TAPPING SLEEVES AND TAPPING VALVES

- A. Sleeves shall be epoxy coated and furnished with stainless steel washers, nuts and bolts. Mueller H-615 and H-619, Ford, or approved equivalent.
- B. Tapping valves shall have flanged inlet, Class 125, conforming to ASME B16.1 and furnished with stainless steel washers, nuts and bolts. Tapping valves shall be constructed with a mechanical joint outlet. Mueller T-687, T-642, T-681, or approved equivalent.

2.15 SERVICE SADDLES AND CORPORATION STOPS

- A. Service Saddles: Saddles shall conform to AWWA C800 and NSF 61.
 - 1. For DIP: Provide bronze or stainless steel body, double strap type with a 200 psi maximum working pressure. Mueller BR2 Series, Ford, or approved equivalent.
 - 2. For PVC: Provide bronze body, wide strap type. Mueller H-13000 Series, Ford, or approved equivalent.
 - 3. For PE: Provide stainless steel body, double strap style with a 250 psi maximum working pressure. Ford FSP-323, or approved equivalent.
- B. Corporation Stops: Provide ground key type; bronze conforming to ASTM B61 or ASTM B62, for a working pressure of 100 psi. and suitable for the working pressure of the system.
 - 1. Ends shall be suitable for adjoining pipe and connections, solder-joint, or flared tube compression type joint.
 - 2. Threaded ends shall conform to AWWA C800.
 - 3. Coupling nut for connection to flared copper tubing shall conform to ASME B16.26.
 - 4. Mueller H-15000 Series with "CC" threads and a copper flare straight connection outlet, Ford, or approved equivalent.

2.16 IDENTIFICATION MATERIALS AND DEVICES

- A. Marker Tape: Provide marker tape consisting of metallic foil bonded to plastic film not less than 2-inches wide. Film shall be inert polyethylene plastic. Film and foil shall each not be less than 1-mil. thick. The tape shall be identified with lettering, not less than 3/4-inch high, "CAUTION: WATER MAIN BELOW," repeated at approximately 24-inch intervals.
- B. Tracer Wire for Nonmetallic Piping: Provide 12 gage, coated copper or aluminum wire not less than 0.10 inch in diameter in sufficient length to be continuous over each separate run of nonmetallic pipe. Wire shall be tied in at all valves.
- C. Recycled Water identification signage is required according to City of Livermore standards.

2.17 SETTLEMENT JOINTS

- A. Flexible joints shall be used if a differential settlement of greater than 2-inches is anticipated. Flexible joints shall be ductile iron rated, rated for 350 psi working pressure and FM approved. Megalug Flextend or approved equivalent.
- B. Provide pipe restraint on either side of flexible joint to resist thrust forces.

2.18 CORROSION PROTECTION

- A. In soils with low resistivity, high sulfides, high/low ph, redox potential and/or poor surrounding drainage conditions, or as indicated in the Contract Documents, encase underground pipe and appurtenances in 4-mil, high-density cross-laminated (HDCL) polyethylene film or 8-mil linear low-density (LLD) polyethylene film in accordance with AWWA/ANSI C105/A21.5. U.S. Pipe, ACIPCO, or approved equivalent.

2.19 CATHODIC PROTECTION

- A. See Section 26 42 00 for cathodic protection requirements.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine surfaces and areas for suitable conditions where water service is being installed.
- B. Do not begin installation until unsatisfactory conditions have been corrected.

3.2 LOCATION OF WATER LINES

- A. Where the location of the water line is not clearly defined by dimensions on the Plans, do not lay water line closer than 10 feet horizontally from any sewer line.
- B. Where water lines cross under gravity sewer lines, encase sewer line in concrete for a distance of at least 10 feet on each side of the crossing, unless sewer line is made of pressure pipe with rubber-gasketed joints and no joint is located within 3 feet horizontally of the crossing.
- C. Where water lines cross sewer force mains and inverted siphons, install water line at least 2 feet above these sewer lines.
- D. When joints in the sewer line are closer than 3 feet horizontally from the water line, encase sewer line joints in concrete.

- E. Do not lay water lines in the same trench with other utilities.
- F. Install water lines at 3'-0" minimum depth or as detailed on Plans.

3.3 INSTALLATION OF PIPING

- A. Inspection:
 - 1. Before placing in position, inspect pipe for noticeable defects. Clean the pipe, fittings, valves, and accessories, and maintain in a clean condition.
 - 2. Remove fins and burrs from pipe and fittings.
- B. Pipe laying and jointing:
 - 1. Provide proper facilities for lowering sections of pipe into trenches.
 - 2. Do not drop or dump pipe, fittings, valves, or any other water line material into trenches.
 - 3. Cut pipe accurately to length established at the site and work into place without springing or forcing. Replace any pipe or fitting that does not allow sufficient space for proper installation of jointing material.
 - 4. Blocking or wedging between bells and spigots will not be permitted. Lay bell-and-spigot pipe with the bell end pointing in the direction of lying.
 - 5. Grade the pipeline in straight lines; avoid the formation of dips and low points.
 - 6. Support pipe at proper elevation and grade.
 - 7. Provide secure firm, uniform support. Wood support blocking will not be permitted.
 - 8. Lay pipe so that the full length of each section of pipe and each fitting rests solidly on the pipe bedding; excavate recesses to accommodate bells, joints, and couplings.
 - 9. Provide anchors and supports where indicated and where necessary for fastening work into place.
 - 10. Make proper provision for expansion and contraction of pipelines.
 - 11. Keep trenches free of water until joints have been properly made.
 - 12. Do not lay pipe when conditions of trench or weather prevent proper installation.
 - 13. All fittings shall be blocked with appropriately sized thrust blocks as shown in the Contract Documents.
- C. Installation of Tracer Wire:
 - 1. Install a continuous length of tracer wire for the full length of each run of nonmetallic pipe.
 - 2. Attach wire to top of pipe in such manner that it will not be displaced during construction operations.
- D. Connections to Existing Lines:
 - 1. Make connections to existing water lines after approval is obtained and with a minimum interruption of service on the existing line.
 - 2. Make connections to existing lines under pressure in accordance with the recommended procedures of a manufacturer of pipe of which the line being tapped is made.
 - 3. The end of each work day, close open ends of pipe temporarily with wood blocks or bulkheads to keep out debris and contamination.

3.4 INSTALLATION OF DUCTILE-IRON PIPING

- A. Install pipe and fittings in accordance with requirements of AWWA C600 for pipe installation, joint assembly, valve-and-fitting installation, and thrust restraint.
- B. Jointing:
 - 1. Provide push-on joints with the gaskets and lubricant specified for this type joint; assemble in accordance with the applicable requirements of AWWA C600 for joint assembly.
 - 2. Provide mechanical joints with the gaskets, glands, bolts, and nuts specified for this type joint; assemble in accordance with the applicable requirements of AWWA C600 for joint assembly and with the recommendations of AWWA C111.
 - 3. Provide flanged joints with the gaskets, bolts, and nuts specified for this type joint.
 - a. Install flanged joints up tight; avoid undue strain on flanges, fittings, valves, and other equipment and accessories.
 - b. Align bolt holes for each flanged joint.

- c. Use full size bolts for the bolt holes; use of undersized bolts to make up for misalignment of bolt holes or for any other purpose will not be permitted.
 - d. Do not allow adjoining flange faces to be out of parallel to such degree that the flanged joint cannot be made watertight without over straining the flange.
 - e. Where flanged pipe and fitting have dimensions that do not allow the installation of a proper flanged joint as specified, replace it by one of proper dimensions.
 - f. Use set screwed flanges to make flanged joints where conditions prevent the use of full-length flanged pipe. Assemble in accordance with the recommendations of the set screwed flange manufacturer.
4. Provide insulating joints with the gaskets, sleeves, washers, bolts, and nuts previously specified for this type joint. Assemble insulating joints as specified for flanged joints. Bolts for insulating sleeves shall be full size for the bolt holes.
 5. Ensure that there is no metal-to-metal contact between dissimilar metals after the joint has been assembled.
- C. Exterior Protection: Completely encase buried ductile iron pipelines and underground appurtenances with polyethylene wrap. Install 8-mil linear low-density polyethylene (LLD) film or 4-mil high-density cross-laminated (HDCL) film per manufacturer's recommendations and in accordance with AWWA/ANSI C105/A21.5 and ASTM A674.
- D. Pipe Anchorage:
1. Provide concrete thrust blocks or restrained joints for pipe anchorage, except where metal harness is indicated on the Construction Documents.
 2. Pipe anchorage shall be in accordance with NFPA 24 Standards.

3.5 INSTALLATION OF POLYVINYL CHLORIDE PIPING

- A. Install pipe and fittings in accordance with the requirements of UNI B-3 for the following:
1. The laying of pipe, joining PVC pipe to fittings and accessories.
 2. The setting of hydrants, valves, and fittings.
- B. Comply with the recommendations for pipe joint assembly and appurtenance installation in AWWA Manual M23, Chapter 7, "Installation."
- C. Comply with the applicable requirements of AWWA C600 for joint assembly, and with the recommendations of Appendix A to AWWA C111.
- D. Jointing:
1. Provide push-on joints with the elastomeric gaskets specified for this type joint, using either elastomeric-gasket bell-end pipe or elastomeric-gasket couplings.
 2. For pipe-to-pipe push-on joint connections, use only pipe with push-on joint ends having factory-made bevel.
 3. For push-on joint connections to metal fittings, valves, and other accessories, cut spigot end of pipe off square and re-bevel pipe end to a bevel approximately the same as that on ductile-iron pipe used for the same type of joint.
 4. Use an approved lubricant recommended by the pipe manufacturer for push-on joints.
 5. Assemble push-on joints for connection to fittings, valves, and other accessories in accordance with the requirements of UNI B-3 for joining PVC pipe to fittings and accessories and with the applicable requirements of AWWA C600 for joint assembly.
 6. Make compression-type joints/mechanical-joints with the gaskets, glands, bolts, nuts, and internal stiffeners previously specified for this type joint. Cut off spigot end of pipe for compression-type joint or mechanical-joint connections and do not re-bevel.
 7. Assemble joints made with sleeve-type mechanical couplings in accordance with the recommendations of the coupling manufacturer using internal stiffeners as previously specified for compression-type joints.
- E. Pipe Anchorage:
1. Provide concrete thrust blocks or restrained joints for pipe anchorage, except where metal harness is indicated on the Construction Documents.

2. Anchorage shall be in accordance with the requirements of UNI B-3 and in accordance with NFPA 24 Standards for reaction or thrust blocking and plugging of dead ends, except that size and positioning of thrust blocks shall be as indicated on the Construction Documents.

3.6 INSTALLATION OF POLYETHYLENE PIPING

- A. Install pipe, fittings, and appurtenances in accordance with PPI and Manufacturer's Recommendations.
- B. Jointing:
 1. Provide mechanical joints, compression fittings, or flanges as recommended by the manufacturer.
 2. Jointing shall be performed using proper equipment and machinery by trained and certified personnel.
 3. Joints, fittings and tools shall be clean and free of burrs, oil, and dirt.
 4. Butt fusion:
 - a. Pipe ends shall be faced to establish clean, parallel mating surfaces.
 - b. Align and securely fasten the components to be joined squarely between the jaws of the joining machine.
 - c. Heat the ends of the pipe to the pipe manufacturer's recommended temperature interface pressure and time duration. A pyrometer or other surface temperature measuring device should be used to insure proper temperature of the heating tool. Temperature indicating crayons shall not be used on a surface which will come into contact with the pipe or fitting.
 - d. Prevent molten plastic from sticking to the heater faces. Molten plastic on the heater faces shall be removed immediately according to the tool manufacturer's instructions.
 - e. Bring the molten ends together with sufficient pressure to properly mix the pipe materials and form a homogeneous joint. Hold the molten joint under pressure until cooled adequately to develop strength. Refer to the Manufacturer's recommendations for temperature, pressure, holding, and cooling times.
 - f. Remove the inside bead from the fusion process using Manufacturer's recommended procedure.
 5. Socket fusion:
 - a. Mixing manufacturers' heating tools and depth gages will not be allowed unless the tools conform to ASTM F1056.
 - b. Pipe ends shall be faced square to establish clean, parallel mating surfaces.
 - c. Clamp the cold ring on the pipe at the proper position using a depth gauge.
 - d. Heat the tool to the pipe manufacturer's recommended temperature. A pyrometer or other surface temperature measuring device should be used to insure proper temperature. Temperature indicating crayons shall not be used on a surface which will come into contact with the pipe or fitting.
 - e. Follow manufacturer's recommendations for bringing the hot tool faces into contact with the outside surface of the end of the pipe and the inside surface of the socket fitting.
 - f. Simultaneously remove the pipe and fitting from the tool.
 - g. Inspect the melt pattern for uniformity and immediately insert the pipe squarely and fully into the socket of the fitting until the fitting contacts the cold ring. Do not twist the pipe or fitting during or after the insertion.
 - h. Hold or block the pipe in place during cooling.
 6. Electrofusion:
 - a. Unless the operation is for a saddle-type electrofusion joint, pipe ends shall be faced square to establish clean, parallel mating surfaces.
 - b. Clamp the pipe and fitting at the proper position in the fixture.
 - c. Connect the electrofusion control box to the fitting and to the power source. Apply the electric current using manufacturer's instructions.
 - d. Allow the joint to cool before removing the clamping fixtures.

3.7 INSTALLATION OF VALVES

- A. Install gate valves conforming to AWWA C500 and UL 262 in accordance with the requirements of AWWA C600 for valve-and-fitting installation and with the recommendations of the Appendix (Installation, operation, and Maintenance of Gate Valves) to AWWA C509.

- B. Install gate valves conforming to AWWA C509 in accordance with the requirements of AWWA C600 for valve-and-fitting installation and with the recommendations of the Appendix (Installation, Operation, and Maintenance of Gate Valves) to AWWA C509.
- C. Install gate valves on PVC water mains in addition in accordance with the recommendations for appurtenance installation in AWWA Manual M23, Chapter 7, "Installation."
- D. Install check valves in accordance with the applicable requirements of AWWA C600 for valve-and-fitting installation, except as otherwise indicated.
- E. Provide and assemble joints to gate valves and check valves as specified for making and assembling the same type joints between pipe and fittings.

3.8 INSTALLATION OF VALVE AND METER BOXES

- A. Boxes shall be centered over the appurtenance so as not to transmit shock or stress. Covers shall be set flush with the surface of the finished pavement, or as shown in the Construction Documents. Backfill shall be placed around the boxes and compacted to the specified level in a manner that will not damage or displace the box from proper alignment or grade. Misaligned boxes shall be excavated, plumbed, and backfilled at no additional cost to the District.

3.9 INSTALLATION OF HYDRANTS

- A. Install hydrants, except for metal harness, plumbed vertical, in accordance with AWWA C600 for hydrant installation and as indicated.
- B. Provide and assemble joints as specified for making and assembling the same type joints between pipe and fittings. Hydrants shall be set so that mounting bolts clear the top of finished grade by three inches so bolts may be easily replace if needed.
- C. Provide metal harness as specified under pipe anchorage requirements for the respective pipeline material to which hydrant is attached.

3.10 SERVICE LINE CONNECTIONS TO WATER MAINS

- A. Connect service lines of size shown on plans to the main with a rigid connection or a corporation stop and gooseneck. Install a gate valve on the service line.
- B. Connect service lines to ductile-iron water mains in accordance with AWWA C600 for service taps.
- C. Connect service lines to PVC plastic water mains in accordance with UNI-B-8 and the recommendations of AWWA Manual M231, Chapter 9, "Service Connections."

3.11 INSTALLATION OF BACKFLOW PREVENTERS

- A. Devices shall be installed horizontal and level, with three feet minimum clearances from obstructions.
- B. Bottom of backflow device shall be 12-24" above grade.

3.12 WATER TANKS

- A. Install water tanks per Manufacturer's recommendations in conformance with AWWA D103.

3.13 HYDROSTATIC PIPELINE TESTING

- A. Requirements:
 - 1. After the pipe has been laid and backfilled, perform hydrostatic pressure tests.

2. Do not conduct tests until at least 12 hours have elapsed since pipe lying and at least 5 days have elapsed since placing of concrete thrust blocks.
3. Fill the pipe with water which shall remain without external application of pressure for 24 hours before tests are conducted.
4. Prior to hydrostatic testing, flush pipe system with fresh water until piping is free of dirt and foreign matter.
5. Apply pressure by a pump and measured by a test gage. All necessary apparatus and labor for conducting the pressure and leakage tests shall be furnished by the Contractor.
6. Ensure the release of air from the line during filling, and prevent collapse due to vacuum when dewatering the line.
7. For pressure test, use a hydrostatic pressure not less than 200 psi for fire water or combined water systems and 1 ½ times operating pressure for domestic water systems. The duration of the test shall not be less than 4 hours with the variation in pressure of not more than 5 psi for the duration of the test.

B. Leakage Tests:

1. At Contractor's option, leakage tests can be performed at the same time as hydrostatic pressure tests.
2. Leakage rate shall be measured for at least 4 hours with a certified water meter, or other approved method. If requested, meter certification shall be submitted to the District for approval prior to testing.
3. Leakage shall not be measured by a drop in pressure in a test section over a period of time.
4. Leakage at mechanical couplings and joints, tapping sleeves, saddles, flanged joints, and copper piping will not be accepted. Correct any visible leaks.
5. Push-on joints: Test ductile iron pipe for leakage in accordance with AWWA C600 as shown in the following table:

TABLE 1
 Allowable Leakage per 1000 feet of DIP Pipeline (Gal/Hr)

Average Test Pressure (psi)	Nominal Pipe Diameter - Inches									
	3	4	6	8	10	12	14	16	18	20
300	0.39	0.52	0.78	1.04	1.30	1.56	1.82	2.08	2.34	2.60
275	0.37	0.50	0.75	1.00	1.24	1.49	1.74	1.99	2.24	2.49
250	0.36	0.47	0.71	0.95	1.19	1.42	1.66	1.90	2.14	2.37
225	0.34	0.45	0.68	0.90	1.13	1.35	1.58	1.80	2.03	2.25
200	0.32	0.43	0.64	0.85	1.06	1.28	1.48	1.70	1.91	2.12

6. When the pipeline under test contains sections of various diameters, the allowable leakage will be the sum of the computed leakage for each size.
7. Test polyvinyl chloride pipe for leakage in accordance with the recommendations of the Uni-Bell Plastic Pipe Association (UNI) as shown in the following table

TABLE 2
 Allowable Leakage per 1000 feet or 50 joints of PVC Pipeline (Gal/Hr)

Nominal Pipe Size (inches)	Average Test Pressure in Line (psi.)	
	200	250
4	0.38	0.43
6	0.57	0.64
8	0.76	0.85
10	0.96	1.07
12	1.15	1.28
14	1.34	1.50
16	1.53	1.71
18	1.72	1.92
20	1.91	2.14

8. Should any section of new pipe fail to pass either test, locate and repair the defective pipe and repeat the test.

3.14 STERILIZATION AND FLUSHING

A. General:

1. Domestic water lines, mains, and branches by chlorination in accordance with AWWA C601 and as herein specified.

B. Sterilization Methods:

1. Liquid Chlorine Solution Method:

- a. Flush all foreign matter from mains, branch runs, hydrant runs, and installed services.
- b. Introduce liquid chlorine solution at appropriate locations to assure uniform distribution through the facilities at the proper concentration.
- c. Do not use installed copper service lines to convey the concentrated chlorine solution to the mains.
- d. The sanitizing solution shall be retained in the facilities for a period of 24 hours after which each service, hydrant run, branch run and dead end shall be flushed until:
 - 1) Residual chlorine is less than 1 part per million.
 - 2) Residual chlorine is no greater than the concentration of chlorine in the water supplied for flushing.
- e. Chlorine shall be a 1 percent solution (containing 10,000 parts per million available chlorine) or shall be obtained by use of dry chlorine in tablet form firmly attached to inside tope of the pipe.
- f. The required concentration of chlorine in the pipe is 50 parts per million. This concentration may be attained by adding 5 gallons of the chlorine solution to 1,000 gallons of water.
- g. The weight of chlorine or chlorine compound required to make a 1 percent chlorine solution is as follows:

TABLE 3
 One-Percent Chlorine Solution Mix

AMOUNT OF PRODUCT COMPOUND		QUANTITY OF WATER (in gallons)
High-Test Calcium Hypochlorite	1 pound	7.50

AMOUNT OF PRODUCT COMPOUND		QUANTITY OF WATER (in gallons)
(65-70% Cl)		
Chlorinated Lime (32-35% Cl)	2 pounds	7.50
Liquid Laundry Bleach (5.25% Cl)	1 gallon	4.25
Liquid Chlorine (100% available chlorine)	0.62 pounds	7.50

2. HTH Tablet Method:
- a. The required concentration of chlorine in the mains may be obtained by the use of HTH tablets as produced by Olin Mathieson in the following quantities or approved equivalent:
 TABLE 4
 HTH Tablet (70%) Dosage
 Number of Tablets Per Length of Pipe

Length of Section	DIAMETER OF PIPE				
	4 inches	6 inches	8 inches	10 inches	12 inches
13 feet	1	2	3	4	6
18 feet	1	2	3	5	6
20 feet	1	2	3	5	7
30 feet	2	3	5	7	10
36 feet	2	3	5	8	12
40 feet	2	4	6	9	14
100 feet	4	9	15	23	30

- b. Tablets are to be fastened to the inside top surface of each length of pipe using "Permatex No. 1" no earlier than the day pipe is laid.
- c. Tablets shall not be installed in the pipe and left overnight before laying and shall not be accessible at any time for casual pilferage by the general public or by children. Tablets shall be stored in a hermetically sealed container.
- d. The new water lines are to be slowly filled with water. Air is to be exhausted from each dead end, branch run, hydrant run, and installed service.
- e. Water shall be retained for a period of 24 hours, after which each service, hydrant run, branch run and dead end shall be thoroughly flushed to clear foreign matter and until:
 - 1) Residual chlorine concentration is less than 1 part per million
 - 2) Residual chlorine is no greater than the concentration of chlorine in the water supplied for flushing.

- C. Bacteriological Testing:
1. Samples shall be gathered and tests conducted at the expense of the Contractor by a laboratory certified by the California Department of Health Services as an Environmental Testing Laboratory (ELAP).
 2. Samples are to be taken at representative points as required by the District and authorities having jurisdiction.

3. The new water lines shall remain isolated and out of service until satisfactory test results have been obtained that:
 - a. Meet the requirements of the California Department of Health Services, Drinking Water Standards.
 - b. District has accepted the results as indicative of the bacteriological condition of the facilities.
 - c. If unsatisfactory or doubtful results are obtained from the initial sampling, repeat the chlorination process until acceptable test results are reported.

3.15 HYDRANT FLOW TESTING

- A. After completion of the pipe and hydrant installation and service connections, the new hydrants shall be flow tested and results provided to the District's Representative and Engineer. The Contract shall provide the following information:
 1. Who performed the test.
 2. Testing date.
 3. Hydrant location.
 4. Static pressure (psig).
 5. Residual pressure (psig).
 6. Flow (gpm).
 7. Orifice size (in.)]

END OF SECTION

SECTION 333000 – SANITARY SEWER

PART 1 - GENERAL

1.1 SUMMARY

- A. This section describes general requirements, products, and methods of execution relating to on-site sanitary sewerage excluding portions within five feet of buildings unless otherwise noted. Any work within the public right-of-way shall be constructed to the standards of the City of Livermore.
 - 1. Sanitary Sewer System, including piping and structures.
- B. Contractor shall provide all labor, equipment, and materials, unless otherwise noted.
- C. Related Sections:
 - 1. Section 31 23 33 – TRENCHING, BACKFILLING, AND COMPACTING.
 - 2. Section 03 30 00 – CAST-IN-PLACE CONCRETE.

1.2 SUBMITTALS

- A. Comply with the requirements of Section 01 33 00 – SUBMITTAL PROCEDURES.
- B. Product Data: Manufacturer's literature and data, including, where applicable, pressure rating, capacity, labels, or other markings on equipment made to the specified standards for materials, for the following:
 - 1. Piping and fittings.
 - 2. Jointing material.
 - 3. Gaskets, couplings, and sleeves.
 - 4. Precast concrete structures, including manholes.
 - 5. Concrete mix design for sanitary structures.
 - 6. Manhole lids and frames.
 - 7. Steps.
 - 8. Clean-out boxes.
 - 9. Backwater valves.
 - 10. Grease interceptor
 - 11. Vent piping and screen

1.3 QUALITY ASSURANCE

- A. Comply with the latest editions of the following Standards and Regulations:
 - 1. American Concrete Pipe Association (ACPA).
 - a. ACPA 01-102 Concrete Pipe Handbook.
 - b. ACPA 01-103 Concrete Pipe Installation Manual.
 - 2. American National Standards Institute (ANSI).
 - a. ANSI B18.5.2.1M Metric Round Head Short Square Neck Bolts.
 - 3. American Railway Engineering & Maintenance-of-Way Association (AREMA).
 - a. AREMA 1-5 Pipelines.
 - 4. American Society for Testing and Materials (ASTM).
 - a. A 123/A 123M Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
 - b. A 307 Carbon Steel Bolts and Studs, 60 000 PSI Tensile Strength.
 - c. A 47 Ferritic Malleable Iron Castings. **
 - d. A 47M Ferritic Malleable Iron Castings (Metric). **

- B. System Description: Grades and elevations are to be established with reference to the benchmarks referenced on the Drawings.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Storage
1. Piping: Inspect materials delivered to site for damage; store with minimum of handling. Store materials on site in enclosures or under protective coverings. Store plastic piping and jointing materials and rubber gaskets under cover out of direct sunlight. Do not store materials directly on the ground. Keep inside of pipes and fittings free of dirt and debris.
 2. Metal Items: Check upon arrival; identify and segregate as to types, functions, and sizes. Store off the ground in a manner affording easy accessibility and not causing excessive rusting or coating with grease or other objectionable materials.
- B. Handling
1. Handle pipe, fittings, and other accessories in such manner as to ensure delivery to the trench in sound undamaged condition. When handling lined pipe, take special care not to damage linings of pipe and fittings; if lining is damaged, make satisfactory repairs. Carry, do not drag, pipe to trench.

PART 2 - PRODUCTS

2.1 PIPING

- A. Polyvinyl Chloride (PVC) Pipe: PVC pipe and fittings conforming to ASTM D3034, SDR 26 with bell-and-spigot type of rubber gasket joints. Bells shall be integral with pipe. Spigot end pipe with separate double hub couplings is not acceptable.
- B. Vitrified Clay Pipe (VCP): VCP and fitting shall conform to ASTM C700, Extra Strength.
- C. Polyethylene Pipe (PE): PE 4710, Pressure Class, DR 11, conforming to AWWA C906. Driscopex 4000/4100, or approved equivalent.
1. Fittings shall conform to AWWA C901 or AWWA C906. Driscopex, or approved equivalent.
 - a. Socket type fittings shall conform to ASTM D2683.
 - b. Butt fusion fittings shall conform to ASTM D3261.
 - c. Electrofusion fittings shall comply with ASTM F1055.

2.2 MANHOLES

- A. Manholes shall be pre-cast concrete of the size and shape shown on the Drawings and shall conform to Sections 70-4.02 of the Caltrans Standard Specifications and to ASTM C478. Equivalent poured-in-place structures may be used at the Contractor's option. Concrete shall consist of Type II cement
- B. Frames and covers shall be cast iron conforming to Section 55-2.03 and 75-1.02 of the Caltrans Standard Specifications. Manhole covers shall have the words "SANITARY SEWER" in letters not less than 2 inches cast into the cover. The clear opening for all manhole covers shall be 24 inches.
- C. All interior concrete surfaces shall be coated with Xypex Concentrate or approved equivalent. Use of a water-resistant admix such as "Xypex Crystalline" is acceptable, at contractor option.

- D. Frames and lids for manholes shall be match-marked in pairs before delivery to the job site. The lids shall fit into their frames without rocking.
- E. Reinforcing Bars: Reinforcing bars shall be of intermediate grade billet steel conforming to ASTM A615 and shall be of the size shown on the Standard Details or in the Drawings. Bars shall be of the round deformed type, free from injurious seams, flaws, or cracks, and shall be cleaned of all rust, dirt, grease and loose scales.
- F. Portland Cement Concrete: Concrete for manhole bases, inlets, and other concrete structures shall be conforming to the requirements of Caltrans Section 90 and as herein specified. The concrete shall be Class 2. The grading of the combined aggregate shall conform with the Caltrans requirements of the 1/2-inch maximum. The consistency of the fresh aggregate shall be such that the slump does not exceed four inches, as determined by Test Method No. Calif. 520. The concrete shall have a minimum design compressive strength of 3,000 psi after 28 days.

2.3 PIPE TO STRUCTURE CONNECTOR/SEAL

- A. flexible pipe to manhole connector shall be used for all pipe penetrations and/or cast-in-place concrete structures.
 - 1. The seal shall provide a flexible, positive, watertight connection between pipe and concrete wastewater structures. The connector shall assure that a seal is made between (1) the connector and the structure wall, and (2) between the connector and the pipe. The seal between the connector and the manhole wall shall be made by casting the connector integrally with the structure wall during the manufacturing process in such a manner that it will not pull out during coupling. The seal between connector and pipe will be made by way of a stainless steel take down band compressing the gasket against the outside diameter of the pipe.
 - 2. The connector shall be molded from materials whose physical/chemical properties meet or exceed the physical/chemical resistant properties outlined in ASTM C-923. The connector and stainless steel hardware shall meet or exceed the performance requirements proscribed in ASTM C-923.
 - 3. The connector shall be of size specifically designed for the pipe material being used and shall be installed in accordance with recommendations of the manufacturer.
 - 4. Connectors shall be Z-LOK or G3 connectors manufactured by A-LOK Products Inc. or approved equivalent.

2.4 CLEAN-OUTS

- A. A box shall be provided for each clean-out. Boxes shall be pre-cast concrete with cast iron frame and cover marked "SAN SEWER"; Christy G05 or approved equivalent.

2.5 BACKWATER VALVES

- A. Backwater valves shall be Josam Series 67500, or approved equivalent.

2.6 SETTLEMENT JOINTS

- A. Flexible joints shall be used if a differential settlement of greater than 2-inches is anticipated. Flexible joints shall be ductile iron rated, rated for 350 psi working pressure and FM approved. Megalug Flextend or approved equivalent.
- B. In forced mains, provide pipe restraint on either side of flexible joint to resist thrust forces.

PART 3 - EXECUTION

3.1 PIPE INSTALLATION

- A. Pipe shall be installed in conformance with Section 31 23 33 – TRENCHING, BACKFILLING, AND COMPACTING, and manufacturer's recommendations.

- B. Pipe laying:
 - 1. No pipe shall be laid until the Geotechnical Engineer inspects and approves the conditions of the bottom of the trench.
 - 2. Pipe laying shall proceed "up grade" with the spigot section of the bell-and-spigot pipe pointing in the direction of the flow.
 - 3. Each section of pipe shall be laid true to line and grade and in such a manner as to form a close concentric joint with the adjoining pipe and to prevent sudden offsets in the flow line.
 - 4. Pipe shall not be laid when the condition of the trench or the weather is unsuitable.
- C. Debris Control:
 - 1. The interior of the sewer pipe shall be kept clean of dirt and debris at all times. When work is not in progress, open ends of pipe and fittings shall be plugged.
 - 2. Where clearing after laying is difficult because of small pipe size, a suitable swab or squeegee shall be kept in the pipe and pulled forward past every joint immediately after joining has been completed.

3.2 POURED-IN-PLACE CONCRETE

- A. Concrete shall be mixed in accordance with applicable provisions of Section 90 of the Caltrans Standard Specifications.
- B. Construction of concrete structures shall conform to applicable provisions of Section 51 of the Caltrans Standard Specifications. Unless otherwise noted herein or in the Drawings, exposed surfaces of structures shall be Class 1 surface finish.
- C. Curing shall conform to applicable portions in Section 90 of Caltrans Standard Specifications. No pigment shall be used in curing compounds. All work shall be subject to inspection. No concrete shall be placed until the District Representative has approved the forms and reinforcement.
- D. Concrete shall not be dropped freely where reinforcing bars will cause segregation, nor shall it be dropped freely more than six feet. Spouts, elephant trunks, or other approved means shall be used to prevent segregation.

3.3 PIPELINE AIR TESTING AND FLUSHING

- A. All new sections of sanitary sewer shall be tested using the following procedures:
 - 1. Test is conducted between two consecutive manholes, or as directed by the District's Representative.
 - 2. The test section of the sewer shall be plugged at each end. One of the plugs used at the manhole shall be tapped and equipped for the air inlet connection for filling the line from an air compressor.
 - 3. All service laterals, stubs, and fittings into the sewer test section shall be properly capped or plugged and carefully braced against the internal pressure to prevent air leakage by slippage and blowout.
 - 4. Connect air hose to tapped plug selected for the air inlet. Connect the other end of the air hose to the portable air control equipment, which consists of valves and pressure gauges used to control the air entry rate into the sewer test section, and to monitor the air pressure in the pipeline. More specifically, the air control equipment includes a shut-off valve, pressure regulating valve, pressure reduction valve, and a monitoring pressure gauge having a pressure range from 0-5 psi. The gauge shall have minimum divisions of 0.10 psi and an accuracy of 0.40 psi.
 - 5. Connect another air hose between the air compressor (or other source of compressed air) and the air control equipment. This completes the test equipment set-up. Test operations may commence.
 - 6. Supply air to the test section slowly, filling the pipeline until a constant pressure of 3.5 psig is maintained. The air pressure must be regulated to prevent the pressure inside the pipe from exceeding 5.0 psig.
 - 7. When constant pressure of 3.5 psig is reached, throttle the air supply to maintain the internal pressure above 3.0 psig for at least 5 minutes. This time permits the temperature of the entering air to equalize with the temperature of the pipe wall. During this stabilization period, it

is advisable to check all capped and plugged fittings with a soap solution to detect any leakage at these connections. If leakage is detected at any cap plug, release the pressure in the line and tighten all leaky caps and plugs. Start the test operation again by supplying air. When it is necessary to bleed off the air to tighten or repair a faulty plug, a new 5-minute interval must be allowed after the pipeline has been refilled.

8. After the stabilization period, adjust the air pressure to 3.5 psig and shut-off or disconnect the air supply. Observe the gauge until the air pressure reached 3.0 psig. At 3.0 psig, commence timing with a stopwatch until the pressure drops to 2.5 psig, at which time the stop watch is stopped. The time required, as shown on the stopwatch, for a pressure loss of 0.5 psig is used to compute the air loss.
9. If the time, in minutes and seconds, for the air pressure drop from 3.0 to 2.5 psi is greater than that shown in the following table for the designated pipe size, the section undergoing test shall have passed and shall be presumed to be free of defects. The test may be discontinued at any time.
10. If the time, in minutes and seconds, for the 0.5 psig drop is less than that shown in the following table for the designated pipe size, the section of the pipe shall not have passed the test; therefore, adequate repairs must be made and the line retested.

Requirements for Air Testing

Pipe in Size (inches)	Minutes	Time (seconds)
4	2	32
6	3	50
8	5	6
10	6	22
12	7	39
14	8	56
15	9	35
16	10	12
18	11	34
20	12	30

(For larger diameter pipe use the following: Minimum time in seconds = 462 x pipe diameter in feet)

11. For 8 inch and smaller pipe, only: if, during the 5 minute saturation period, pressure drops less than 0.5 psig after the initial pressurization and air is not added, the pipe section undergoing test shall have passed.
12. Multi-pipe sizes: when the sewer line undergoing test is 8 inch or larger diameter pipe and includes 4 inch or 6 inch laterals, the figures in the table for uniform sewer main sizes will not give reliable or accurate criteria for the test. Where multi-pipe sizes are to undergo the air test, the State's representative can compute the "average" size in inches which is then multiplied by 38.2 seconds. The results will give the minimum time in seconds acceptable for a pressure drop of 0.5 psig for the "averaged" diameter pipe.
13. Adjustment Required for Groundwater:
 - a. An air pressure correction is required when the ground water table is above the sewer line being tested. Under this condition, the air test pressure must be increased .433 psi for each foot the ground water level is above the invert of the pipe.
 - b. Where ground water is encountered or is anticipated to be above the sewer pipe before the air testing will be conducted, the following procedure shall be implemented at the time the sewer main and manholes are constructed.
 - 1) Install a ½ inch diameter pipe nipple (threaded one or both ends, approximately 10 inch long) through the manhole wall directly on top of one of the sewer pipes entering the manhole with threaded end of nipple extending inside the manhole.
 - 2) Seal pipe nipple with a threaded 1/2 inch cap.
 - 3) Immediately before air testing, determine the ground water level by removing the threaded cap from the nipple, blowing air through the pipe nipple to remove any obstruction, and then connecting a clear plastic tube to the pipe nipple.
 - 4) Hold plastic tube vertically permitting water to rise in it to the groundwater level.

- 5) After water level has stabilized in plastic tube, measure vertical height of water, in feet, above invert of sewer pipe.
- 6) Determine air pressure correction, which must be added to the 3.0 psig normal starting pressure of test, by dividing the vertical height in feet by 2.31. The result gives the air pressure correction in pounds per square inch to be added.
Example: if the vertical height of water from the sewer invert to the top of the water column measures 11.55 feet, the additional air pressure required would be:
 $(11.55)/(2.31) = 5.0$ psig
Therefore, the starting pressure of the test would be 3.0 plus 5 or 8.0 psig, and the ½ pound drop becomes 7.5 psig. There is no change in the allowable drop (0.5 psig) or in the time requirements established for the basic air test.

3.4 DEFLECTION TESTING & CLEANING

- A. Flush system pipelines, manholes and related structures with water to clean. A metal screen shall be used downstream at the point of connection to the existing system to collect and remove any rock or other debris that is flushed out during cleaning. Reclaimed water shall be used where available.
- B. Upon completion of work, perform a deflection test on entire length of installed plastic pipeline. Completed work includes superimposed loads adjacent to and over the pipeline, such as compacted backfill and earthwork, and does not include paving, concrete curbs and gutters, sidewalks, walkways, and landscaping.
- C. Under external loads, deflection of pipe in the installed pipeline shall not exceed 4.5 percent of the average inside diameter of pipe.
- D. Determine whether the allowable deflection has been exceeded by use of a pull-through device or a deflection-measuring device.
- E. Pull-Through Device:
 1. Provide a spherical, spheroidal, or elliptical ball, a cylinder, or circular sections fused to a common shaft.
 - a. Circular sections shall be so spaced on the shaft that distance from external faces of front and back sections will equal or exceed diameter of the circular section.
 - b. Pull-through device may also be of a design approved by the Uni-Bell Plastic Pipe Association, provided that the device meets the applicable requirements specified in this paragraph, including those for diameter of the device.
 2. Ball, cylinder, or circular sections shall conform to the following:
 - a. A diameter, or minor diameter as applicable, of 95 percent of the average inside diameter of the pipe; tolerance of plus 0.5 percent will be permitted.
 - b. A homogeneous material throughout, with a density greater than 1.0 as related to water at 39.2 degrees F, and a surface Brinell hardness of not less than 150.
 - c. Center bored and through bolted with a ¼ inch minimum diameter steel shaft having yield strength of not less than 70,000 pounds per square inch, with eyes or loops at each end for attaching pulling cables.
 - d. Each eye or loop shall be suitably backed with a flange or heavy washer such that a pull exerted on opposite end of shaft will produce compression throughout remote end.
 3. Pull-Through Device:
 - a. Pass the pull-through device through each run of pipe, either by pulling it through or flushing it through with water.
 - b. If the device fails to pass freely through a pipe run, replace pipe which has the excessive deflection and completely retest in same manner and under same conditions as specified.
- F. Deflection measuring Device:
 1. Sensitive to 1.0 percent of the diameter of the pipe being tested and accurate to 1.0 percent of the indicated dimension.
 2. Obtain approval of deflection measuring device prior to use.
- G. Deflection Measuring Device Procedure:

1. Measure deflections through each run of installed pipe.
 2. If deflection readings in excess of 4.5 percent of average inside diameter of pipe are obtained, retest pipe by a run from the opposite direction.
 3. If retest continues to show a deflection in excess of 4.5 percent of average inside diameter of pipe, remove pipe which has excessive deflections, replace with new pipe, and completely retest in same manner and under same conditions.
- H. Warranty Period Test: Pipe found to have a deflection of greater than 5 percent of average inside diameter when deflection test is performed just prior to end of 1 year warranty period shall be replaced with new pipe and tested as specified for leakage and deflection.

3.5 VIDEO INSPECTION

- A. After completion of the pipe installation, service connections, flushing and cleaning, and prior to placement of pavement, the sewer line shall be video inspected with a color closed-circuit television with tilt-head camera recorded in DVD format. Two (2) copies of the inspection DVD and log sheets shall be provided to the [District's/Owner's Representative].
1. The following observations from video inspections will be considered defects in the construction of sewer pipelines and will require correction prior to placement of pavement:
 - a. Low spot (1/2 inch or greater - mainlines only).
 - b. Joint separations (1/4 inch or greater opening between pipe sections).
 - c. Cocked joints present in straight runs or on the wrong side of pipe curves.
 - d. Chips in pipe ends.
 - e. Cracked or damaged pipe.
 - f. Dropped joints.
 - g. Infiltration.
 - h. Debris or other foreign objects.
 - i. Other obvious deficiencies.
 - j. Irregular condition without logical explanation.

END OF SECTION

SECTION 334000 - STORM DRAINAGE

PART 1 - GENERAL

1.1 SUMMARY

- A. This section describes general requirements, products, and methods of execution relating to on-site storm drainage excluding portions within five feet of buildings unless otherwise noted. Any work within the public right-of-way shall be constructed to the standards of the City of Livermore County of Alameda; State of California Department of Transportation; as may be appropriate.
 - 1. Storm drain piping.
 - 2. Storm drain structures including curb inlets, catch basins, area drains, and manholes.
- B. Contractor shall provide all labor, equipment, and materials, unless otherwise noted.
- C. Related Sections:
 - 1. Section 31 23 33 – TRENCHING, BACKFILLING, AND COMPACTING.

1.2 SUBMITTALS

- A. Comply with the requirements of Section 01 33 00 – SUBMITTAL PROCEDURES.
- B. Product Data: Manufacturer's literature and data, including, where applicable, pressure rating, capacity, labels, or other markings on equipment made to the specified standards for materials, for the following:
 - 1. Piping and fittings.
 - 2. Jointing material.
 - 3. Gaskets, couplings, and sleeves.
 - 4. Precast concrete structures, including manholes and drainage inlets.
 - 5. Concrete mix design for precast and cast-in-place structures.
 - 6. Manhole lids and frames.
 - 7. Manhole steps.
 - 8. Pipe to Structure Connection Seal.
 - 9. Drainage inlet grates and frames.

1.3 QUALITY ASSURANCE

- A. Comply with the latest editions of the following Standards and Regulations:
 - 1. American Society for Testing and Materials (ASTM).
 - a. A74: Cast Iron Soil Pipe and Fittings.
 - b. A615: Deformed and Plain Billet-Steel Bars for Reinforcement.
 - c. B32: Solder Metal.
 - d. C76: Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe.
 - e. C150: Portland Cement.
 - f. C478: Precast Reinforced Concrete Manhole Sections.
 - g. C494: Chemical Admixtures for Concrete.
 - h. C920-02: Elastomeric Joint Sealants.
 - i. D2241-00: Poly (Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR Series).
 - j. D2680-01 Acrylonitrile-Butadiene-Styrene (ABS) and Poly (Vinyl Chloride) (PVC) Composite Sewer Piping.
 - k. D2729: Perforated PVC Drain Pipe.
 - l. D3034-00: Type PSM Polyvinyl Chloride (PVC) Sewer pipe and Fittings.
 - m. F1336-02: Poly (Vinyl Chloride) (PVC) Gasketed Sewer Fittings.
 - 2. California Department of Transportation (Caltrans): Standard Specifications:
 - a. Section 51: Concrete Structures.
 - b. Section 52: Reinforcement.
 - c. Section 55: Steel Structures.
 - d. Section 66: Corrugated Metal Pipe.
 - e. Section 70: Miscellaneous Facilities.

- f. Section 72: Slope Protection.
- g. Section 75: Miscellaneous Metal.
- h. Section 90: Portland Cement Concrete.
3. County of Alameda Standard Plans and Specifications.
4. American Association of State Highway and Transportation Officials (AASHTO) for H20 Loading.
5. American Concrete Institute (ACI).
6. Other authorities having jurisdiction.

- B. System Description: Grades and elevations are to be established with reference to the benchmarks referenced on the Drawings.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Storage
1. Piping: Inspect materials delivered to site for damage; store with minimum of handling. Store materials on site in enclosures or under protective coverings. Store plastic piping and jointing materials and rubber gaskets under cover out of direct sunlight. Do not store materials directly on the ground. Keep inside of pipes and fittings free of dirt and debris.
 2. Metal Items: Check upon arrival; identify and segregate as to types, functions, and sizes. Store off the ground in a manner affording easy accessibility and not causing excessive rusting or coating with grease or other objectionable materials.
 3. Cement, Aggregate, and Reinforcement: As specified in Section 03 30 00 – Cast-In-Place Concrete.
- B. Handling
1. Handle pipe, fittings, and other accessories in such manner as to ensure delivery to the trench in sound undamaged condition. When handling lined pipe, take special care not to damage linings of pipe and fittings; if lining is damaged, make satisfactory repairs. Carry, do not drag, pipe to trench.

PART 2 - PRODUCTS

2.1 PIPING

- A. Polyvinyl Chloride (PVC) Pipe: PVC pipe conforming to ASTM D3034, SDR 26 with bell-and-spigot type of rubber gasket joints. Bells shall be integral with pipe. Spigot end pipe with separate double hub couplings is not acceptable.
- B. Reinforced Concrete Pipe (RCP): RCP shall conform to ASTM C76 with tongue-and-groove or bell-and-spigot joints. Unless indicated otherwise on the plans, all reinforced concrete pipe shall be Class III, 1350-D pipe.
- C. High-Density Polyethylene (HDPE) Pipe: HDPE Pipe shall conform to AASHTO M294 Type S. Acceptable for use in non-vehicular areas ONLY.
- D. Polyethylene Pipe (PE): PE 4710, Pressure Class 160, DR 13.5, conforming to AWWA C906. Driscoplex 4000/4100, or approved equivalent.
- E. Perforated Pipe: PVC conforming to ASTM D2729 or HDPE SDR 17 conforming to AWWA C906

2.2 MANHOLES

- A. Manholes shall be pre-cast concrete of the size and shape shown on the Drawings and shall conform to Sections 70-4.02 of the Caltrans Standard Specifications and to ASTM C478. Equivalent poured-in-place structures may be used at the Contractor's option. Concrete shall consist of Type II cement.

- B. Frames and covers shall be cast iron conforming to Section 75-2.02B of the Caltrans Standard Specifications. Manhole covers shall have the words "STORM DRAIN" in letters not less than 2-inches cast into the cover. The clear opening for all manhole covers shall be 24 inches.
- C. All interior concrete surfaces shall be coated with Xypex Concentrate or approved equivalent. Use of a water-resistant admix such as "Xypex Crystalline" is acceptable, at Contractor's option.
- D. Frames and grates for manholes and catch basins shall be match-marked in pairs before delivery to the job site. Grates shall be ductile iron conforming to Section 75-2.02B of the Caltrans Standard Specifications. The grates shall fit into their frames without rocking. Grates shall have a maximum opening of one-half inch between bars, unless otherwise noted in the Drawings. All drainage inlets shall be marked with a stencil or permanent label reading "NO DUMPING FLOWS TO CREEK."
- E. Reinforcing Bars: Reinforcing bars shall be of intermediate grade billet steel conforming to ASTM A615 and shall be of the size shown on the Standard Details or in the Drawings. Bars shall be of the round deformed type, free from injurious seams, flaws, or cracks, and shall be cleaned of all rust, dirt, grease and loose scales.
- F. Portland Cement Concrete: Concrete for manhole bases, inlets, and other concrete structures shall conform to the requirements of Caltrans Section 90 and as herein specified. The concrete shall be minor concrete. The grading of the combined aggregate shall conform with the Caltrans requirements of the 1/2-inch maximum. The consistency of the fresh aggregate shall be such that the slump does not exceed four inches, as determined by Test Method No. Calif. 520. The concrete shall have a minimum design compressive strength of 3,000 psi after 28 days.

2.3 PIPE TO STRUCTURE CONNECTOR/SEAL

- A. A flexible pipe to manhole connector shall be used for all pipe penetrations and/or cast-in-place concrete structures.
 - 1. The seal shall provide a flexible, positive, watertight connection between pipe and concrete wastewater structures. The connector shall assure that a seal is made between (1) the connector and the structure wall, and (2) between the connector and the pipe. The seal between the connector and the manhole wall shall be made by casting the connector integrally with the structure wall during the manufacturing process in such a manner that it will not pull out during coupling. The seal between connector and pipe will be made by way of a stainless steel take down band compressing the gasket against the outside diameter of the pipe.
 - 2. The connector shall be molded from materials whose physical/chemical properties meet or exceed the physical/chemical resistant properties outlined in ASTM C-923. The connector and stainless steel hardware shall meet or exceed the performance requirements proscribed in ASTM C-923.
 - 3. The connector shall be of size specifically designed for the pipe material being used and shall be installed in accordance with recommendations of the manufacturer.
 - 4. Connectors shall be Z-LOK or G3 connectors manufactured by A-LOK Products Inc. or approved equivalent.

2.4 CLEAN-OUTS

- A. A box shall be provided for each clean-out. Boxes shall be pre-cast concrete with cast iron frame and cover marked "STORM DRAIN"; Christy G05 or approved equivalent.

2.5 CULVERT AND OUTFALL HEADWALLS

- A. All headwalls shall be constructed in conformance with Caltrans Standard Plans as indicated.

PART 3 - EXECUTION

3.1 PIPE INSTALLATION

- A. Pipe shall be installed in conformance with Section 31 23 33 – TRENCHING, BACKFILLING AND COMPACTING, and manufacturer's recommendations. HDPE pipe shall be installed in conformance with ASTM D2321 and as recommended by the pipe manufacturer. HDPE pipe is acceptable for use in non-vehicular areas ONLY.
- B. Pipe laying:
 - 1. No pipe shall be laid until the Geotechnical Engineer inspects and approves the conditions of the bottom of the trench.
 - 2. Pipe laying shall proceed "up grade" with the spigot section of the bell-and-spigot pipe pointing in the direction of the flow.
 - 3. Each section of pipe shall be laid true to line and grade and in such a manner as to form a close concentric joint with the adjoining pipe and to prevent sudden offsets in the flow line.
 - 4. Pipe shall not be laid when the condition of the trench or the weather is unsuitable.
- C. Debris Control:
 - 1. The interior of the sewer pipe shall be kept clean of dirt and debris at all times. When work is not in progress, open ends of pipe and fittings shall be plugged.
 - 2. Where clearing after laying is difficult because of small pipe size, a suitable swab or squeegee shall be kept in the pipe and pulled forward past every joint immediately after joining has been completed.

3.2 POURED-IN-PLACE CONCRETE

- A. Concrete shall be mixed in accordance with applicable provisions of Section 90 of the Caltrans Standard Specifications.
- B. Construction of concrete structures shall conform to applicable provisions of Section 51 of the Caltrans Standard Specifications. Unless otherwise noted herein or in the Drawings, exposed surfaces of structures shall be Class 1 surface finish.
- C. Curing shall conform to applicable portions in Section 90 of Caltrans Standard Specifications. No pigment shall be used in curing compounds. All work shall be subject to inspection. No concrete shall be placed until the District Representative has approved the forms and reinforcement.
- D. Concrete shall not be dropped freely where reinforcing bars will cause segregation, nor shall it be dropped freely more than six feet. Spouts, elephant trunks, or other approved means shall be used to prevent segregation.

3.3 PIPELINE FLUSHING

- A. Newly constructed storm drain pipes shall be flushed with water to clean. A metal screen shall be used to collect and remove any rock, silt and other debris that is flushed out during cleaning. Reclaimed water shall be used where available.

3.4 DEFLECTION TESTING

- A. Upon completion of work, perform a deflection test on entire length of installed plastic pipeline. Completed work includes superimposed loads adjacent to and over the pipeline, such as compacted backfill and earthwork, and does not include paving, concrete curbs and gutters, sidewalks, walkways, and landscaping.
- B. Under external loads, deflection of pipe in the installed pipeline shall not exceed 4.5 percent of the average inside diameter of pipe.
- C. Determine whether the allowable deflection has been exceeded by use of a pull-through device or a deflection-measuring device.
- D. Pull-Through Device:

1. Provide a spherical, spheroidal, or elliptical ball, a cylinder, or circular sections fused to a common shaft.
 - a. Circular sections shall be so spaced on the shaft that distance from external faces of front and back sections will equal or exceed diameter of the circular section.
 - b. Pull-through device may also be of a design approved by the Uni-Bell Plastic Pipe Association, provided that the device meets the applicable requirements specified in this paragraph, including those for diameter of the device.
 2. Ball, cylinder, or circular sections shall conform to the following:
 - a. A diameter, or minor diameter as applicable, of 95 percent of the average inside diameter of the pipe; tolerance of plus 0.5 percent will be permitted.
 - b. A homogeneous material throughout, with a density greater than 1.0 as related to water at 39.2 degrees F, and a surface Brinell hardness of not less than 150.
 - c. Center bored and through bolted with a ¼ inch minimum diameter steel shaft having yield strength of not less than 70,000 pounds per square inch, with eyes or loops at each end for attaching pulling cables.
 - d. Each eye or loop shall be suitably backed with a flange or heavy washer such that a pull exerted on opposite end of shaft will produce compression throughout remote end.
 3. Pull-Through Device:
 - a. Pass the pull-through device through each run of pipe, either by pulling it through or flushing it through with water.
 - b. If the device fails to pass freely through a pipe run, replace pipe which has the excessive deflection and completely retest in same manner and under same conditions as specified.
- E. Deflection measuring Device:
1. Sensitive to 1.0 percent of the diameter of the pipe being tested and accurate to 1.0 percent of the indicated dimension.
 2. Obtain approval of deflection measuring device prior to use.
- F. Deflection Measuring Device Procedure:
1. Measure deflections through each run of installed pipe.
 2. If deflection readings in excess of 4.5 percent of average inside diameter of pipe are obtained, retest pipe by a run from the opposite direction.
 3. If retest continues to show a deflection in excess of 4.5 percent of average inside diameter of pipe, remove pipe which has excessive deflections, replace with new pipe, and completely retest in same manner and under same conditions.
- G. Warranty Period Test: Pipe found to have a deflection of greater than 5 percent of average inside diameter when deflection test is performed just prior to end of 1 year warranty period shall be replaced with new pipe and tested as specified for leakage and deflection.

3.5 CLEANING

- A. Thoroughly clean storm drain lines, manholes, catch basins, field inlets, culverts, and similar structures, of dirt, debris, and obstructions of any kind.

3.6 VIDEO INSPECTION

- A. After completion of the pipe installation, service connections, flushing and cleaning, and prior to placement of pavement, the storm drainage line shall be televised with a color closed-circuit television with tilt-head camera recorded in DVD format. The original DVD and log sheets shall be provided to the District.
1. The following observations from television inspections will be considered defects in the construction of sewer pipelines and will require correction prior to placement of pavement:
 - a. Low spot (1 inch or greater - mainlines only).
 - b. Joint separations (3/4 inch or greater opening between pipe sections).
 - c. Cocked joints present in straight runs or on the wrong side of pipe curves.
 - d. Chips in pipe ends.
 - e. Cracked or damaged pipe.
 - f. Dropped joints.
 - g. Infiltration.

- h. Debris or other foreign objects.
- i. Other obvious deficiencies.
- j. Irregular condition without logical explanation.

END OF SECTION

SECTION 33 47 27 - BIORETENTION

PART 1 - GENERAL

1.1 SUMMARY

- A. This section includes:
 - 1. Bioretention Soil Mix (BSM)
 - 2. Aggregate Storage
 - 3. Mulch
 - 4. Streambed Gravel / Energy Dissipation Rock

- B. Related Sections:
 - 1. Section 31 20 00 – Earthwork and Grading
 - 2. Section 32 80 00 – Landscape Irrigation
 - 3. Section 32 90 00 – Planting

1.2 QUALITY ASSURANCE

- A. Comply with the latest editions of the following Standards and Regulations:
 - 1. Caltrans Standard Specifications
 - 2. American Society for Testing and Materials (ASTM), Philadelphia, PA, 1997 or latest edition
 - 3. NDPES Municipal Regional Permit: Attachment L
 - 4. Alameda County Clean Water Program C.3 Stormwater Technical Guidance document

1.3 DEFINITIONS

- A. Bioretention Soil Mix (BSM): A soil mix that has been specially blended and tested for use in bioretention facilities with the intent to meet the following objectives:
 - 1. Be sufficiently permeable to infiltrate runoff at a minimum rate of 5 inches per hour during the life of the facility, and
 - 2. Have sufficient moisture retention to support healthy vegetation.
 - 3. Consist of the following mixture of fine sand and compost, measured on a volume basis:
 - 4. 60%-70% Sand
 - 5. 30%-40% Compost

1.4 SUBMITTALS

- A. Pre-Installation Submittals: The Contractor shall submit to the Architect for approval:
 - 1. Bioretention Soil Submittals:
 - a. Certification from the soil supplier or an accredited laboratory that the Bioretention Soil meets the requirements of this specification.
 - b. Batch-specific test results and certification shall be required for projects installing more than 100 cubic yards of bioretention soil.
 - c. Grain size analysis results of the fine sand component performed in accordance with ASTM D422, Standard Test Method for Particle Size Analysis of Soils or Caltrans Test Method (CTM) C202.
 - d. Quality analysis results for compost performed in accordance with Seal of Testing Assurance (STA) standards, as specified in PART 4 of this specification section .
 - e. Organic content test results of mixed Bioretention Soil. Organic content test shall be performed in accordance with Testing Methods for the Examination of Compost and Composting (TMECC) 05.07A, "Loss-On-Ignition Organic Matter Method".
 - f. Grain size analysis results of compost component performed in accordance with ASTM D422, Standard Test Method for Particle Size Analysis of Soils.
 - g. A description of the equipment and methods used to mix the sand and compost to produce Bioretention Soil.
 - 1) Provide the name of the testing laboratory(s) and the following information:
 - 2) Contact person(s)
 - 3) Address(s)

- 4) Phone contact(s)
 - 5) E-mail address(s)
 - 6) Qualifications of laboratory(s), and personnel including date of current certification by USCC STA, ASTM, Caltrans, or approved equivalent.
2. Other Submittals
- a. Cut sheets of any media or soil admixes to enhance moisture retention properties, if used.
 - b. Testing agency qualifications as specified in Section 1.06.B.
 - c. Streambed gravel / energy dissipation rock sieve analysis.

1.5 QUALITY CONTROL AND QUALITY ASSURANCE

- A. General: Test and inspect bioretention materials and operations as work progresses as described in this section. Failure to detect defective work or materials at any time will not prevent rejection if a defect is discovered after installation, nor shall it constitute final acceptance.
- B. Testing Agency Qualification:
1. General: Agencies that perform testing on bioretention materials, including permeability testing, shall be accredited by STA, ASTM, AASHTO, or other designated recognized standards organization. All certifications shall be current. Testing agency shall be capable of performing all tests to the designated and recognized standards specified and shall provide test results with an accompanying Manufacturer's Certificate of Compliance. Tests must be conducted within 120 days prior to the delivery date of the bioretention soil to the project site. The following information shall be provided for all testing laboratories used:
 - a. Name of lab(s) and contact person(s)
 - b. Address(es) and phone number(s)
 - c. Email address(es)
 - d. Qualifications of laboratory and personnel including the date of current certification by USCC STA, ASTM, Caltrans, or approved equivalent.
 2. Compost: Laboratory that performs testing shall be independent, enrolled in the US Composting Council's (USCC) Compost Analysis Proficiency (CAP) program, and perform testing in accordance with USCC Test Method for The Examination of Composting and Compost (TMECC). The sample collection protocol can be obtained from the U.S. Composting Council, 4250 Veterans Memorial Highway, Suite 275, Holbrook, NY 11741, 631-737-4931, www.compostingcouncil.org.
- C. Responsibilities of Contractor
1. Pre-Placement Conference: A pre-placement conference will take place, including at a minimum the Landscape Architect, the Civil Engineer, the District's Representative, Installer, and general Contractor, to review schedule, products, soil testing, permeability testing, and installation. The Contractor shall notify the Civil Engineer a minimum of 5 working days prior to conference.
 2. Testing: All testing specified herein is the responsibility of the Contractor and shall be conducted by an independent testing agency, retained by the Contractor. The District's Representative reserves the right to conduct additional testing on all materials submitted, delivered, or in-place to ensure compliance with Specifications.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Protect the BSM and mulch from contamination and all sources of additional moisture at supplier site, during transport, and at the project site, until incorporated into the work.
- B. The Contractor is required to coordinate delivery of BSM and aggregates with bioretention facility construction and soil installation. A written schedule shall be submitted for review as part of the submittal package. BSM should not be stockpiled onsite for any length of time. In no case shall BSM be stockpiled onsite for more than 24 hours without prior written approval by the Civil Engineer. If stockpiling onsite for any length of time, BSM stockpiles shall meet the following requirements:
1. Locate stockpiles away from drainage courses, inlets, sewer cleanout vents, and concentrated stormwater flows
 2. Place stockpiles on geotextile fabric

3. Cover stockpiles with plastic or comparable material
4. Contain stockpiles (and prevent contamination from adjacent stockpiles) with temporary perimeter barrier (e.g., sand bags, wattles, silt fence).

PART 2 - PRODUCTS

2.1 BIORETENTION SOIL MIX (BSM):

A. Sand for Bioretention Soil:

1. Sand shall be free of wood, waste, coating such as clay, stone dust, carbonate, etc., or any other deleterious material. All aggregate passing the No. 200 sieve size shall be non-plastic.
2. Sand for Bioretention Soils shall be analyzed by an accredited lab using #200, #100, #40 or #50, #30, #16, #8, #4, and 3/8-inch sieves (ASTM C422, Caltrans CTM 202, or as approved by municipality), and meet the following gradation:

1.

Sieve Size	Percent Passing by Weight	
	Min	Max
3/8 inch	100	100
No. 4	90	100
No. 8	70	100
No. 16	40	95
No. 30	15	70
No. 40 or No. 50	5	55
No. 100	0	15
No. 200	0	5

Note: all sands complying with ASTM C33 for fine aggregate comply with the above gradation requirements.

B. Composted Material: Compost shall be well decomposed, stable, weed free organic matter source derived from waste materials including yard debris, wood wastes or other organic materials not including manure or biosolids meeting the standards developed by the US Composting Council (USCC). The product shall be certified through the USCC Seal of Testing Assurance (STA) Program (a compost testing and information disclosure program).

1. Compost Quality Analysis by Laboratory – Before delivery of the soil, the supplier shall submit a copy of lab analysis performed by a laboratory that is enrolled in the US Composting Council’s Compost Analysis Proficiency (CAP) program and using approved Test Methods for the Examination of Composting and Compost (TMECC). The lab report shall verify:
 - a. Organic Matter Content: 35% to 75% by dry weight.
 - b. Carbon and Nitrogen Ratio: C:N < 25:1 and C:N > 15:1.
 - c. Maturity/Stability: Any one of the following is required to indicate stability:
 - 1) Oxygen Test < 1.3 O₂ /unit TS /hr
 - 2) Specific Oxygen Test < 1.5 O₂ / unit BVS /hr
 - 3) Respiration test < 8 mg CO₂-C /g OM / day (or < 8 C / unit VS / day)
 - 4) Dewar test < 20°C temperature rise (maximum)
 - 5) Solvita® > 5 Index value
 - d. Toxicity: Any one of the following measures is sufficient to indicate non-toxicity:
 - 1) NH₄⁺: NO₃-N < 3
 - 2) Ammonium < 500 ppm, dry basis
 - 3) Seed Germination > 80% of control
 - 4) Plant Trials > 80% of control
 - 5) Solvita® > 5 Index value
 - e. Nutrient Content: provide analysis detailing nutrient content including N-P-K, Ca, Na, Mg, S, and B.

- 1) Total Nitrogen content 0.9% or above.
- 2) Boron: Total shall be < 80 ppm; soluble shall be <2.5 ppm.
- f. Salinity: Must be reported; < 6.0 mmhos/cm
- g. pH shall be between 6.5 and 8. May vary with plant species.
2. Compost Quality Analysis by Compost Supplier – Before delivery of the compost to the soil supplier the Compost Supplier shall verify the following:
 - a. Feedstock materials shall be specified and include one or more of the following: landscaping/yard trimmings, grass clippings, food scraps, and agricultural crop residues.
 - b. Maturity/Stability: shall have a dark brown color and a soil-like odor. Compost exhibiting a sour or putrid smell or containing recognizable grass or leaves, or is hot (120F) upon delivery or rewetting is not acceptable.
 - c. Weed seed/pathogen destruction: provide proof of process to further reduce pathogens (PFRP). For example, turned windrows must reach min. 55C for 15 days with at least 5 turnings during that period.
3. Compost for Bioretention Soil Texture – Compost for bioretention soils shall be analyzed by an accredited lab using #200, 1/4 inch, 1/2 inch, and 1 inch sieves (ASTM D422 or as approved by municipality), and meet the following gradation:

Sieve Size	Percent Passing by Weight	
	Min	Max
1 inch	99	100
1/2 inch	90	100
1/4 inch ¹	40	99
No. 200	1	10

¹Max percent passing by Weight for the 1/4 inch sieve has been increased in response to locally available materials.
4. Bulk density shall be between 500 to 1,100 dry lbs/cubic yard.
5. Moisture content shall be between 30% - 55% of dry solids.
6. Inerts - compost shall be relatively free of inert ingredients, including glass, plastic and paper, < 1% by weight or volume.
7. Select Pathogens – Salmonella < 3 MPN/4 grams of TS, or Coliform Bacteria < 10,000 MPN/gram.
8. Trace Contaminants Metals (lead, mercury, etc.): Product must meet US EPA, 40 CFR 503 regulations.
9. Compost Testing – The compost supplier shall test all compost products within 120 calendar days prior to application. Samples shall be taken using the STA sample collection protocol. The sample collection protocol can be obtained from the U.S. Composting Council, 4250 Veterans Memorial Highway, Suite 275, Holbrook, NY 11741, phone: 631-737-4931, www.compostingcouncil.org. The sample shall be sent to an independent STA Program-approved lab.

2.2 VERIFICATION OF ALTERNATIVE BIORETENTION SOIL MIXES

- A. Alternative soils for bioretention facilities shall be sufficiently permeable to infiltrate runoff at a minimum rate of 5 inches per hour during the life of the facility, and provide sufficient retention of moisture and nutrients to support healthy vegetation.
 1. General Requirements: Bioretention soil shall achieve a long-term, in-place infiltration rate of at least 5 inches per hour. Bioretention soil shall support vigorous plant growth.
 - a. Pre-installation Submittals: The applicant shall submit the soil mixture for approval.
 - 1) A minimum one-gallon size sample of mixed bioretention soil.
 - 2) Certification from the soil supplier or an accredited laboratory that the Bioretention Soil meets the requirements of this specification.
 - 3) Certification from an accredited geotechnical testing laboratory that the Bioretention Soil has an infiltration rate between 5 and 12 inches per hour as tested according to Section 2.02.1.b(ii)(2) below.
 - 4) Batch-specific test results and certification shall be required for projects installing more than 100 cubic yards of bioretention soil.
 - 5) Organic content test results of mixed Bioretention Soil. Organic content test shall be performed in accordance with Testing Methods for the Examination of Compost and Composting (TMECC) 05.07A, “Loss-On-Ignition Organic Matter Method”.

- 6) Grain size analysis results of mixed bioretention soil performed in accordance with ASTM D422, Standard Test Method for Particle Size Analysis of Soils.
- 7) A description of the equipment and methods used to mix the sand and compost to produce Bioretention Soil.
- 8) Provide the name of the testing laboratory(s) and the following information:
 - a) Contact person(s)
 - b) Address(s)
 - c) Phone contact(s)
 - d) E-mail address(s)
 - e) Qualifications of laboratory(s), and personnel including date of current certification by USCC STA, ASTM, Caltrans, or approved equivalent.

B. Bioretention Soil Mix (BSM)

1. Bioretention Soil Texture: Bioretention soil mix shall be analyzed by an accredited lab using #200, and 1/2 inch sieves (ASTM D422 or as approved by the local municipality), and meet the following gradation:

2.

Sieve Size	Percent Passing (by Weight)	
	Min	Max
1/2 inch	97	100
No. 200	2	5

2. Bioretention Soil Permeability testing: Bioretention soil mix shall be analyzed by an accredited geotechnical laboratory for the following tests:
 - a. Moisture – density relationships (compaction tests) shall be conducted on bioretention soil. Bioretention soil for the permeability test shall be compacted to 85 to 90 percent of the maximum dry density (ASTM D1557).
 - b. Constant head permeability testing in accordance with ASTM D2434 shall be conducted on a minimum of two samples with a 6-inch mold and vacuum saturation.

2.3 AGGREGATE STORAGE

- A. Aggregate Storage shall be Class 2 permeable material per Caltrans Standard Specification Section 68-2.02F(3) and shall consist of hard, durable, and clean, sand, gravel, or mechanically crushed stone, substantially free from adherent coatings. Materials shall be washed thoroughly to remove fines, organic matter, extraneous debris, or objectionable materials. On-site recycled materials are not permitted.

- B. Aggregate Storage shall meet the following specifications for grading and quality:

1. Aggregate gradation testing in accordance with ASTM C136 at least once per 500 cubic yards.

Sieve ¹	Percent Passing by Weight
	Caltrans Class 2 Permeable Aggregate ³
1 inch	100
3/4 inch	90 to 100
1/2 inch	–
3/8 inch	40 to 100
No. 4	25 to 40
No. 8	18 to 33
No. 16	–
No. 30	5 to 15
No. 50	0 to 7
No. 200 ²	0 to 3

¹Sieve provided in nominal size square openings or United States Standard Sieve Series sizes.

²Gradation modified from ASTM for portion passing the No. 200 sieve

³Per Caltrans Standard Specification Section 68-2.02F(3)

3. **Crushed Particles:** 90 percent (minimum) fractured faces tested in accordance with California Test 205. Do not use rounded river gravel.
4. **L.A Abrasion:** 40 percent (maximum) tested in accordance with ASTM C 131.

2.4 MULCH

A. General

1. Aged mulch, also called compost mulch, reduces the ability of weeds to establish, keeps soil moist and replenishes soil nutrients.
2. Mulch must not contain more than 0.1 percent of deleterious materials such as rocks, glass, plastics, metals, clods, weeds, weed seeds, coarse objects, sticks larger than the specified particle size, salts, paint, petroleum products, pesticides or other chemical residues harmful to plant or animal life.
3. Mulch shall be tree trimming mulch, or approved equivalent such as arbor mulch.

B. Tree Trimming Mulch

1. Tree trimming mulch must be derived from chipped trees and may contain leaves and small twigs. Materials shall conform to Caltrans Standard Specification Section 20-5.04B(5).
2. Tree trimming mulch must have a particle size such that a minimum of 95 percent of the material by volume is less than 3 inches and no more than 30 percent by volume is less than 1 inch.

2.5 STREAMBED GRAVEL / ENERGY DISSIPATION ROCK

A. General

1. Streambed Cobbles shall be clean, naturally occurring water rounded gravel material.
2. Streambed Cobbles shall have a well-graded distribution of cobble sizes and conform to the following gradation:

Streambed Cobbles

Approximate Size	Percent Passing by Weight
5 inch	100
4 inch	90–100
3 inch	25–40
2 inch	0–10

- a. Approximate size can be determined by taking the average dimension of the three axes of the rock, Length, Width, and Thickness, by use of the following calculation: $(\text{Length} + \text{Width} + \text{Thickness})/3 = \text{Approximate Size}$ Length is the longest axis, width is the second longest axis, and thickness is the shortest axis.
3. The grading of the cobbles shall be determined by the Contractor by visual inspection of the load before it is dumped into place, or, if so ordered by the Civil Engineer, by dumping individual loads on a flat surface and sorting and measuring the individual rocks contained in the load.
4. Cobbles must be washed before placement

PART 3 - EXECUTION

3.1 GENERAL

- A. Prevent runoff from adjacent pervious and impervious surfaces from entering the bioretention facility (e.g., sand bag roof drains, flow diversion) until authorization is given by the Civil Engineer.

- B. Exclude equipment from bioretention facilities. No equipment shall operate within the facility once bioretention facility construction has begun, including during and after excavation, backfilling, mulching, or planting.
- C. Prevent foreign materials and substances, such as silt laden run-off, construction debris, paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid from entering or being stored in the facility at any point during construction.
- D. The District's Representative may, at any time, conduct additional testing on all materials submitted, delivered, or in-place, to ensure compliance with the Specifications. Testing may include permeability testing per ASTM D2434 (Modified), density testing per ASTM D6938, etc., if the Engineer/Landscape Architect suspects the facility does not conform to these specifications (e.g., as evidenced by lower than anticipated infiltration capacity).
- E. Contractor to provide Civil Engineer written records documenting dates; company name of participants; descriptions; locations; and results of tests and/or measurements undertaken as described in PART 3 of this specification. Contractor to provide written records to Civil Engineer no more than 2 work days after completion of test and/or measurement (e.g. "01 January 2018, Cherry Tree Landscapes, soil density measured, FTP 01, 81 percent compaction").

3.2 GRADING

- A. The Contractor shall not start bioretention facility grading until all areas draining to the facility are stabilized and authorization has been given by the Civil Engineer.
- B. Construct bioretention facility subgrade to +/- 3/4 inch of the grades and slopes specified on the construction documents.
- C. Excavation within 6 inches of final native soil grade shall not be permitted if facility soils have standing water, or have been subjected to more than 1/2 inch of precipitation within the previous 48 hours.

3.3 SUBGRADE PREPARATION AND PROTECTION

- A. Protect the bioretention excavation from over compaction and/or contamination.
 - 1. Areas which have been over compacted by equipment or vehicle traffic or by other means and which need to be ripped, over excavated receive additional scarification, or other restorative means shall be done at the Contractor's expense and at the direction of the Civil Engineer.
 - 2. Excavated areas contaminated by sediment-laden runoff prior to placement of BSM or aggregate storage material shall be remediated at the Contractor's expense by removing the contaminated soil (top 3 inches minimum) and replacing with a suitable material, as determined by the Civil Engineer.
- B. Remove all trash, debris, construction waste, cement dust and/or slurry, or any other materials that may impede infiltration into prepare subgrade.
- C. The subgrade shall be inspected and accepted by the Civil Engineer prior to placement of any materials or final subgrade scarification.
- D. Scarify the surface of the subgrade to a minimum depth of 3 inches immediately prior to placement of BSM or aggregate storage material. Acceptable methods of scarification include use of excavator bucket teeth or a rototiller to loosen the surface of the subgrade.
- E. Place aggregate storage material where shown on drawings with conveyor belt or with an excavator or loader from a height no higher than 6 feet unless otherwise approved by the Engineer. Do not dump material directly from truck into the cell.

- F. Aggregate storage areas contaminated by sediment-laden runoff prior to placement of BSM shall be remediated at the Contractor's expense by removing the contaminated aggregate storage material (top 3 inches minimum or as directed by the Civil Engineer and replacing with clean aggregate storage material per Section 2.03, to the lines and grades on the contract documents.
- G. Aggregate storage material shall be inspected and accepted for placement and finish grade by the Engineer prior to the installation of BSM. Any material that does not conform to this specification shall be removed and replaced with acceptable material or remediated to the satisfaction of the Civil Engineer, at the Contractors' expense.

3.4 BIORETENTION SOIL MIX (BSM) PLACEMENT

- A. The Contractor shall not place BSM until the [District's/Owner's Representative] has reviewed and confirmed the following:
 - 1. BSM delivery ticket(s): Delivery tickets shall show that the full delivered amount of BSM matches the product type, volume and manufacturer named in the submittals. Each delivered batch of BSM shall be accompanied by a certification letter from the supplier verifying that the material meets specifications and is supplied from the approved BSM stockpile.
 - 2. Visual match with submitted samples: Delivered product will be compared to the submitted 1-gallon sample, to verify that it matches the submitted sample. The Civil Engineer may inspect any loads of BSM on delivery and stop placement if the soil does not appear to match the submittals; and require sampling and testing of the delivered soil to determine if the soil meets the requirements of Section 2.01 of this specification before authorizing soil placement.
 - 3. Inspection of the aggregate storage layer, underdrain, cleanout, and overflow structure installation by the Civil Engineer or third-party peer reviewer, to confirm it is built per plan.
- B. BSM placement, grading and consolidation shall not occur when the BSM is excessively wet, or has been subjected to more than 1/2 inch of precipitation within 48 hours prior to placement. Excessively wet is defined as being at or above 22 percent soil moisture by a General Tools & Instruments DSMM500 Precision Digital Soil Moisture Meter with Probe (or equivalent). A minimum of three readings with the soil moisture probe will be used to determine the average percent soil moisture reading per each truck load. There should be no visible free water in the material.
- C. The Contractor shall place BSM loosely with a conveyor belt or other means from a height no higher than 6 feet, unless otherwise approved by the Civil Engineer. Soil shall be placed in accordance with these Specifications and in conformity with the lines, grades, depth, and typical cross-section shown in the Drawings or as established by the Civil Engineer.
- D. Excessively dry BSM may be lightly and uniformly moistened, as necessary, to facilitate placement and workability.
- E. Compact BSM using non-mechanical compaction methods (e.g., boot packing, hand tamping, or water consolidation) to 83 percent (+/- 2 percent) of the maximum dry density per modified Proctor test (ASTM D1557), or as directed by the Geotechnical Engineer. Determination of in-place density shall be made using a nuclear gauge per ASTM D6938. Moisture content determination shall be conducted on a soil sample taken at the location of the nuclear gage reading per ASTM D2216.
- F. Grade BSM to a smooth, uniform surface plane with loose, uniformly fine texture. Rake, remove ridges, and fill depressions to meet finish grades.
- G. Final soil depth shall be measured and verified only after the soil has been compacted. If after consolidation, the soil is not within +/- 3/4 inch of the grades and slopes specified on the Plans, add material to bring it up to final grade and rake.
- H. The BSM shall be inspected and accepted for placement and finish grade by the Civil Engineer prior to the installation of planting and mulch. Any BSM that does not conform to this Specification shall be remediated to the satisfaction of the Civil Engineer, or removed and replaced with acceptable BSM, at the Contractor's expense.

3.5 PLANTING AND MULCHING

- A. Bioretention facilities shall be planted and mulched as shown on the contract documents.
- B. Bioretention facilities shall not be planted or mulched when soils are excessively wet as defined in Section 3.04 of this specification.
- C. Bioretention facility areas contaminated by sediment laden runoff prior to planting or placement of mulch shall be remediated at the Contractor's expense by removing the contaminated BSM (top 3 inches minimum) and replacing with BSM per Section 2.01 of this specification, to the lines and grades on the contract documents.
- D. All mulch shall be inspected and accepted by the Landscape Architect to ensure appropriate depth and material prior to facility commissioning (e.g., unblocking of inlets).

3.6 FLOOD TESTING

- A. Inlets shall be constructed per the contract documents and free from all obstructions prior to commencing flow testing.
- B. Testing shall be conducted at the conclusion of the 90-day plant grow-in period. Protection and flow diversion measures shall be removed in their entirety prior to commencing flow testing.
- C. Underdrains shall be plugged at the outlet structure to minimize water consumption during testing.
- D. Prior to testing, broom sweep gutter and other impervious surfaces within the test area to remove sediments and other objectionable materials.
- E. The Civil Engineer shall be present during the demonstration. The Contractor shall notify the Civil Engineer a minimum of 5 working days prior to testing.
- F. The Contractor shall water test each facility to demonstrate that all inlet curb openings are capturing and diverting all water in the gutter to the facility, outlet structures are engaging at the elevation specified, and the designed ponding depth is achieved. Testing shall include application of water from a hydrant or water truck, at a minimum rate of 10 gallons per minute, into the gutter a minimum of 15 feet upstream of the inlet curb opening being tested. Each inlet shall be tested individually. If erosion occurs during testing, restore soils, plants, and other affected materials.
- G. Landscape Architect and/or Civil Engineer will identify deficiencies and required corrections, including but not limited to relocating misplaced plants, adjusting streambed gravel, adjusting mulch, adjusting inlets, splash aprons, and forebays, removing and replacing inlets, and removing debris.
- H. Once adjustments are made, the Contractor shall re-test to confirm all test water flows into the facility from the roof drains and correct any remaining deficiencies identified by Civil Engineer.
- I. Inlets, outlets, and other bioretention facility appurtenances shall not be accepted until testing and any required correction and retesting is complete and accepted by the Civil Engineer.

END OF SECTION
